Skin cancer develops in people of all ages, races, and nationalities. It can also develop on any area of the body, including these six unlikely places.

If you see a spot that’s changing, itching, or bleeding on any area of your body, see a board-certified dermatologist. When found early, skin cancer is highly treatable.

You can protect your skin from the sun and reduce your skin cancer risk by seeking shade, wearing sun-protective clothing — including a wide-brimmed hat and sunglasses with UV protection — and applying a broad-spectrum, water-resistant sunscreen with an SPF of 30 or higher to all skin not covered by clothing.
