

# TELUS Managed AWS

Get the most value from your AWS deployment with flexible managed cloud services from TELUS

Amazon Web Services (AWS) offers compute, storage, network and database products that can be used as building blocks to host and run your applications or workloads. With more than 120 services available and a constantly evolving platform, architecting the right AWS solution and managing it can be challenging. That's where we can help.

A clear strategy is needed to identify the right workloads to be moved to the AWS cloud platform and to right-size the infrastructure for optimal application performance and cost optimization. In addition, best practices must be implemented to improve business outcomes, lower consumption costs, reduce operational overhead and mitigate security risks.

## Leverage TELUS expertise to optimize your AWS management

Whether you have already deployed AWS in your organization or are considering it, TELUS can help. Offload the management of your complex, ever-evolving AWS cloud infrastructure to free up your internal IT teams so they can focus on strategic projects, while improving your security and compliance, and lowering your AWS consumption costs.

We recognize that you may have multiple AWS services requiring varying levels of support, that's why TELUS offers two levels of Managed AWS.

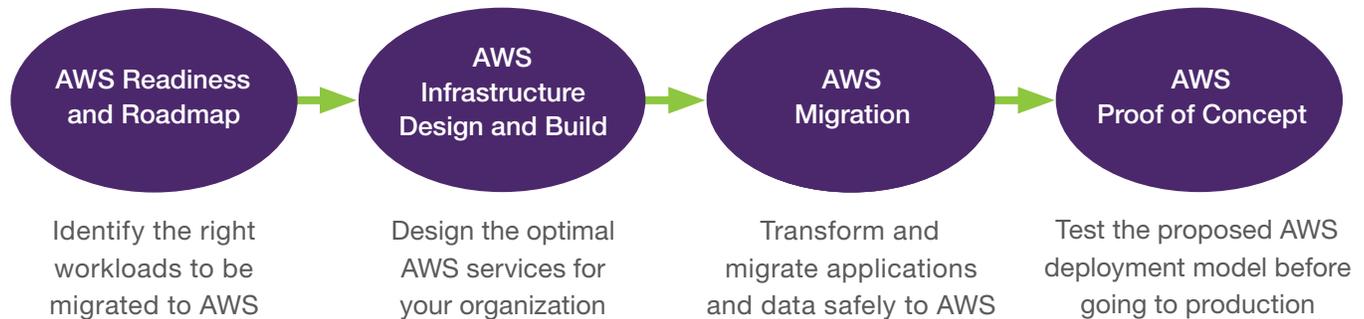

On average, organizations reported being able to deploy new server resources **97.1%** faster with AWS, and able to respond to unexpected IT changes in **97.6%** less time.<sup>1</sup>
