

App Identity on AWS

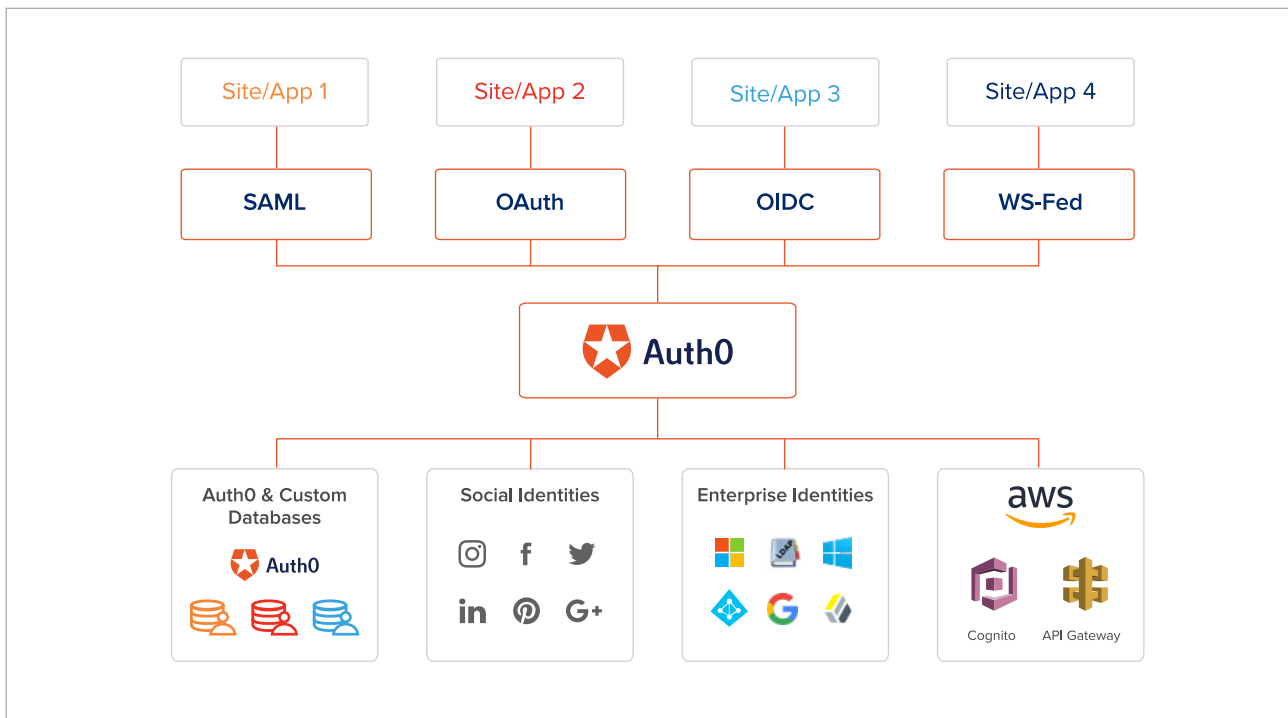

Identity for external facing, revenue generating applications.

The Auth0 identity platform provides authentication and authorization as a service, securely handling over 2.5 billion logins per month. At Auth0 we give developers and companies the building blocks they need to secure their applications without having to become security experts.

You can connect any application, written in any language or on any stack, to Auth0 and define the identity providers you want to use (how you want your users to log in). Based on your app's technolo-

gy, choose one of our SDKs or call our API and hook it up to your app. Now each time a user tries to authenticate, Auth0 will verify their identity and send the required information back to your app.

The Auth0 platform architecture leverages AWS Auto Scaling groups to achieve any level of scalability and multiple AWS Availability Zones to offer seamless high-availability. Auth0's disaster recovery strategy has a two-region-failover approach leveraging a second AWS region.

These Auth0 features are available on your AWS cloud or ours, and give you the flexibility to quickly deliver on almost any Identity, Authentication, or Authorization use-case.

- | | |
|---|---|
| ✓ Machine to Machine Authentication | ✓ All 5 domains of SOC 2 |
| ✓ Act as an external Authorizer for an AWS API Gateway | ✓ HIPAA Compliance |
| ✓ Secure code-paths and Lambda functions | ✓ Custom Domains |
| ✓ Secure IoT devices | ✓ Enterprise Integrations |
| ✓ Prebuilt IdP Connections | ✓ User Management |
| ✓ Enterprise Directory Connections (yours or your customer's) | ✓ Log Retention |
| ✓ Auth0 Database as a primary store or virtual directory | ✓ Programmatic control of all settings, scopes, and configuration |
| ✓ Passwordless Authentication Secure Just-In-Time Database Migration (no password resets) | ✓ Permissions and Roles Management |
| ✓ Translate protocols and transform tokens and assertions | ✓ Account Linking |
| ✓ Connect to external Databases and User Stores | ✓ Integrate with your source control |
| ✓ Consolidation of User Silos | ✓ Integrate with your build pipeline |
| ✓ Configurable Long Lived Sessions | ✓ Built-in Email Workflows |
| ✓ Strong branding and white-labelling for all user facing aspect | ✓ 3rd party options for SMTP/SMS gateways |
| ✓ User and Application specific Metadata storage | ✓ Email Customizations |
| ✓ Business logic, policy enforcement, and data/service integrations with FaaS based Rules | ✓ Breached Password Notification |
| | ✓ Built-in and 3rd Party Multifactor Authentication |
| | ✓ SLAs |
| | ✓ Enterprise Support |
