

The following grass seed mixture should be used on all airport property.

80% Kentucky 31 Tall Fescue (With Endophyte) (*Festuca Arundinacea*)
20% Italian Ryegrass (*Lolium Multiflorum*)

This mixture should yield the best results for both the grass and the lack of wildlife attractants. The areas that this mixture is applied should be monitored for wildlife to ensure that the mixture is ideal for our environment.

If percentages are changed to 85/15 or 90/10 there is really no difference, the only constant should be that no other form of ryegrass be used besides Italian ryegrass (*lolium multiflorum*) very species specific.

Off airfield projects that involve the use of landscape grasses should adhere to these restrictions as much as possible. Any other mixture should be approved by USDA or the Wildlife Coordinator at CVG.
