

Horizon-Keeler #2 Line Coating

PGE is improving an existing transmission line

Project overview

PGE is improving a 1.5-mile transmission line south of U.S. Highway 26 near Hillsboro Stadium. Robots will apply a high-temperature protective coating that shields power lines from heat like sunscreen. This upgrade will allow the line to carry up to 20% more electricity and improve performance during hot weather.

Where the work will take place

The project will connect a PGE substation near **NE 59th Avenue** and **NE Bennett Street** with a Bonneville Power Administration substation near **NE Cornelius Pass Road** and **NE Evergreen Parkway**.

What are the benefits

Improving existing equipment with better technology helps PGE meet growing demand without the need for new power lines. This lowers costs and speeds up improvements to the electric grid.

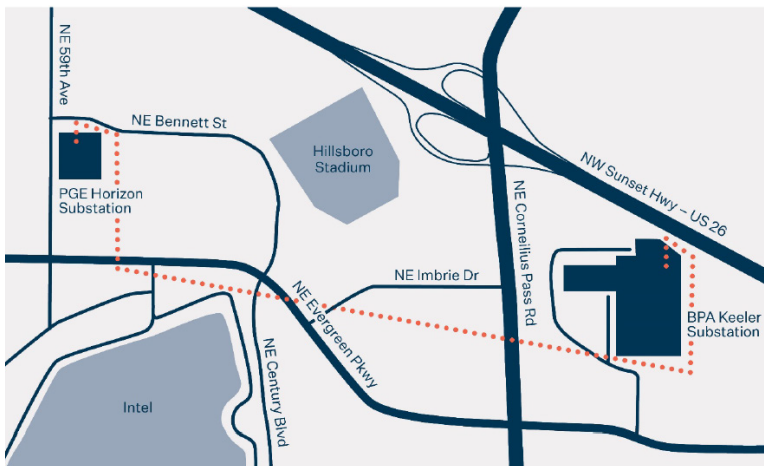

What to expect and when

Work is expected to start in early October and finish in November.

Some sidewalks and traffic lanes may close for a short time. Please watch for flaggers and follow the posted detour signs.

..... Location of transmission line
