

Diet After Fundoplication

Fundoplication is a type of surgery to treat gastroesophageal reflux disease (GERD). People with GERD have chronic, severe heartburn. GERD happens when the muscle at the end of the esophagus is too loose. Food and other stomach contents come up into the esophagus which can be very painful. This surgery tightens this muscle, so food and stomach contents then stay in the stomach. The pain and heartburn will go away.

You will be on a full liquid diet for 2-3 weeks to help you heal. The full liquid diet includes any clear liquids, fruit and vegetable juices, cooked cereals, milk, yogurt, strained soups and frozen desserts.

Purees allow you to eat thin, pourable foods. These foods have an applesauce-like consistency. You may thin foods with water, broth, milk or fruit juice. You will need a blender or food processor to puree your food. Please follow this diet until you see your surgeon at your post-surgery visit.

Diet Guidelines

- Eat and drink slowly.
- Aim for small, frequent meals. This will help you meet your calorie and protein goals.
- All foods must be thinned enough to pour off a spoon.
- Protein smoothies and oral nutritional supplements are best.
- Avoid carbonated drinks.
- No straws. Straws cause you to swallow air leading to pain.
- Do not chew gum and tobacco.
- Very hot or cold foods may cause esophageal spasms.
- Try to eat smaller amounts of citrus, tomato, caffeine, and chocolate if they are causing heartburn.
- If you are sensitive to dairy products, try lactose reduced milk (Lactaid®). Other dairy free milk options are almond, cashew, soy or rice milk.
- Medicines can be taken whole; they do not need to be crushed. Talk to your doctor if start taking a new medicine.
- You need more protein to help you heal. Include a good source of protein with meals and snacks. You should eat 60-80 grams per day.
