

**What to Expect When Death is Approaching
A Guide to Common Signs and Symptoms at the End of Life**

This handout provides information on many signs and symptoms patients may experience as they near the end of life. Knowing these signs may help you better deal with the final process of life, and how you can offer comfort to your loved one. It is important to remember that not all of these signs or symptoms appear at the same time. Some may never appear. Nurses, doctors, and other caregivers are always nearby to help you through this trying time. If you have any questions or concerns, let us know. We are here to help.

Signs of Approaching Death	What You Can Do to Comfort and Support
<p>Greater Need for Sleep The person will tend to sleep more and may need help with simple tasks. This is the body slowing down.</p>	<ul style="list-style-type: none"> • Watch for times when your loved one is more awake. • Plan to do things and to talk with the person when he or she is more alert.
<p>Confusion/Disorientation Due to changes in the body, a dying person may be confused about time, place and people.</p> <p>Symbolic Language Sometimes patients will use words that may lead family to believe the patient is confused. They may speak to someone who is no longer there.</p>	<ul style="list-style-type: none"> • Gently remind the person of the time and day. • Let him or her know who you are and who is nearby. • You may wish to bring in a few favorite items like pictures, a blanket, or music. • A supportive presence is encouraged, and we suggest you listen to what is said as it can often be very meaningful.
<p>Changes in Bowel and Bladder There may be less urine and it may change in color. Due to nervous system changes and weaker muscles, some people lose control of body functions as death nears.</p>	<ul style="list-style-type: none"> • A protective garment may be used and will be changed often. • The nurse may place a catheter into the bladder to collect urine and to help avoid skin breakdown.
<p>Changes in Skin Temperature and Color As circulation slows down, arms and legs may become cool to touch and/or darker or paler in color.</p>	<ul style="list-style-type: none"> • Use light covers and gently turn the person side to side every few hours for comfort. • Heating pads or electric blankets should not be used.
<p>Changes in Breathing There may be times when the person breathes very fast or very slow. They may not breathe for a few seconds to more than a minute. This is normal the closer they are to death.</p>	<ul style="list-style-type: none"> • Raise the head of the bed or use pillows to prop them up. • Nurses may give medicine if the person seems uncomfortable.

<p>Noisy Breathing/Congestion The person who is dying will probably drink less and may not be able to cough up mucous as well. It can collect in the back of the throat causing noisy breathing.</p>	<ul style="list-style-type: none"> • Turn the person on their side or raise the head of the bed. • Extra pillows may help. • Nurses may use medicines if the person seems uncomfortable.
<p>Changes in Hearing and Vision A person's senses aren't as good as the nervous system slows.</p>	<ul style="list-style-type: none"> • You may want to keep lights on in the room during the hours he/she is awake. • Talk with your family member and explain what you are doing. • Show your feelings. • Say the things you may not have said yet. Encourage others to do the same. Include children and older relatives; they may want or need to say good-bye in their own way.
<p>Restlessness and Anxiety The patient may seem restless and pull at the sheets. He may see some things you cannot see. This can happen as the blood flow slows and less oxygen reaches the brain.</p>	<ul style="list-style-type: none"> • Stay calm and speak slowly. • Offer simple reminders of the time, where he is, and who you are. • Music may be calming and sometimes medicine may be used.
<p>Changes in Pain As death nears, there may be an increase or decrease in pain.</p>	<ul style="list-style-type: none"> • Tell your nurse or doctor if the person seems to be in more pain. • Ask for pain medicines as often as needed. People do not die from too much pain medicine. They die because the disease takes over the body.
<p>Decreased Desire or Need for Food and Fluids The person you are close to may not take or want food or fluids as they need these less and may have a dry mouth.</p>	<ul style="list-style-type: none"> • The loss of desire to eat and drink is a natural part of the dying process. • If the person can swallow, offer ice chips, use mouth swabs and lip balm.

What Do You Do When Death Has Occurred?

At the time of death, the person is no longer breathing and has no pulse. The eyelids and the mouth may be slightly open. The person will not respond when gently shaken or spoken to. If you think your loved one has died, tell the nurse. They will notify the doctor. When someone dies, you may feel many emotions. Great sadness, loss, frustration, and relief are just a few of the feelings you may have. There is no right or wrong way to respond to death. Take as much time as you need. Always remember, nurses, doctors, social workers and chaplains are nearby to work with you and help you during this stressful time of grief and loss.
