System: The bi-amplified GENELEC 1031A is a two-way active monitoring speaker designed to produce high SPL output, low coloration and broad bandwidth in a small cabinet size. The 1031A is ideal for applications where space is at a premium such as Near Field monitoring, mobile vans, broadcast and TV control rooms, surround sound systems and budget and home studios. Designed as an active speaker, the 1031A contains drivers, power amplifiers, active crossover filters and protection circuitry. The Directivity Control Waveguide™ (DCW™) technology used provides excellent frequency balance even in difficult acoustic environments.

Drivers: The low frequencies are reproduced by a 210 mm (8") bass driver loaded in a 15 liter vented cabinet. The -3 dB point lies at 47 Hz and the frequency response extends down to 43 Hz (-6 dB).

The high frequency driver is a 19 mm (3/4") metal dome. Uniform dispersion control is achieved with the innovative DCW Technology pioneered by Genelec, which also provides perfect phase and delay uniformity at the crossover frequency.

Both drivers are magnetically shielded.

Crossover: The active crossover network consists of two parallel bandpass filters. Acoustically, the filters are complementary and the slopes are 24 dB/octave. The crossover frequency is 2.2 kHz. The active crossover controls ('treble tilt', 'bass tilt' and 'bass roll-off') allow this speaker to be exactly matched to any room environment.

Amplifiers: The amplifier unit is mounted to the rear of the speaker enclosure on quick release vibration isolators, to ensure rattle free operation and long term reliability. The bass and treble amplifier produce respectively 120 Watts of short term power. The peak output sound pressure level of the 1031A exceeds 120 dB at 1 m. The unit incorporates special circuitry for driver overload and amplifier thermal overload protection. Variable input sensitivity allows for accurate level matching to console output section.

Installation: Each 1031A monitor is supplied with a mains cable and an operating manual. After unpacking, place the speaker so that its acoustical axis (see figure 2) is aimed towards the listening position. Do not place the speaker in a horizontal position as this may cause acoustical cancellation problems around the crossover frequency.

Sufficient cooling for the amplifier must be ensured if the speaker is installed in a restricted space such as a cabinet or integrated into a wall structure. The minimum clearance for the amplifier is 10 centimeters (4") to any object. The space adjacent to the amplifier must either be ventilated or sufficiently large to dissipate heat so that the ambient temperature does not rise above 35 degrees Celsius (95°F).

Setting the input sensitivity: The input sensitivity of the speakers can be matched to the output of the mixing console, or other source, by adjusting the input sensitivity control on the rear panel (see figure 4). A small screwdriver is needed for the adjustment. The manufacturer's default setting for this control is -6 dBu (fully clockwise) which gives an SPL of 100 dB @ 1 m with -6 dBu input level. Note that to get the full output level of 110 dB SPL, an input level of +4dBu is needed in this setting.

Setting tone controls: The response of the system may also have to be adjusted to match the acoustic environment. The adjustment is done by setting...
the three tone control switch groups 'treble tilt', 'bass tilt' and 'bass roll-off' on the rear panel of the amplifier. The factory settings for these controls are 'All Off' to give a flat anechoic response. See Table 1 for suggested tone control settings. Figure 5 shows the effect of the controls on the anechoic response. Always start adjustment by setting all switches to 'OFF' position. Then set only one switch to the 'ON' position to select the response curve needed. If more than one switch is set to 'ON' (within one switch group) the attenuation value is not accurate.

Vertical / horizontal mounting
The speakers are normally delivered set up for vertical mounting. Horizontal mounting should be avoided due to the increased likelihood of early reflections that degrade the direct sound. If horizontal mounting is needed the DCW plate may be rotated so that the Genelec logo remains horizontal by removing the four corner screws of the DCW and carefully lifting and turning the DCW.

Console top mounting
If the 1031A's are used for near field monitoring, avoid mounting them on the meter bridge of the console. Instead position the speakers slightly behind the console by using floor stands or wall mounts. This prevents the first reflections from the console surface from coloring the sound.

Overload indicators
The speaker is provided with two status LED's marked 'OVL' and 'ON'. The green ON-LED when lit indicates that the speaker is ready for use. The red OVL-LED indicates that the amplifier is overloaded or the driver protection circuit is activated. In both cases reduce the signal level so that the LED stops blinking. If the OVL-LED stays on constantly it indicates that the amplifier thermal protection is activated. Let the amplifier cool down and check that the ventilation at the rear side of the speaker is not blocked. There should be a clearance of more than 4" (10cm) between speaker rear and any solid surface.

Maintenance
No user serviceable parts are to be found within the amplifier unit. Any maintenance or repair of the 1031A unit should only be undertaken by qualified service personnel.

Safety considerations
Although the 1031A has been designed in accordance with international safety standards, to ensure safe operation and to maintain the instrument under safe operating conditions, the following warnings and cautions must be observed:

1. Servicing and adjustment must only be performed by qualified service personnel. The amplifier's rear panel must not be opened.

2. Do not use this product with an unearthen mains cable as this may lead to personal injury.

3. To prevent fire or electric shock, do not expose the unit to water or moisture. Do not place any objects filled with liquid, such as vases on the speaker or near it.

4. Note that the amplifier is not completely disconnected from the AC mains service unless the mains power cord is removed from the amplifier or the mains outlet.

WARNING!
This equipment is capable of producing sound pressure levels in excess of 85 dB, which may cause permanent hearing damage.

Guarantee
This product is supplied with one year guarantee against manufacturing faults or defects that might alter the performance of the 1031A unit. Refer to supplier for full sales and guarantee terms.
**SYSTEM SPECIFICATIONS**

Lower cut-off frequency, -3 dB: \[ \leq 47 \text{ Hz} \]

Upper cut-off frequency, -3 dB: \[ \geq 22 \text{ kHz} \]

Free field frequency response of system: \[ 48 \text{ Hz} - 22 \text{ kHz} \ (\pm 2 \text{ dB}) \]

Maximum short term sine wave acoustic output on axis in half space, averaged from 100 Hz to 3 kHz:
- @ 1m \[ \geq 110 \text{ dB SPL} \]
- @ 0.5m \[ \geq 116 \text{ dB SPL} \]

Maximum long term RMS acoustic output in same conditions with IEC weighted noise (limited by driver unit protection circuit):
- @ 1m \[ \geq 101 \text{ dB SPL} \]
- @ 0.5m \[ \geq 107 \text{ dB SPL} \]

Maximum peak acoustic output per pair above console top, @ 1 m from the engineer with music material: \[ \geq 120 \text{ dB} \]

Self generated noise level in free field @ 1 m on axis: \[ \leq 10 \text{ dB} \] (A-weighted)

Harmonic distortion at 90 dB SPL @ 1m on axis:
- Freq: 50...100 Hz \[ < 3\% \]
- > 100 Hz \[ < 0.5\% \]

Drivers:
- Bass 210 mm (8") cone
- Treble 19 mm (3/4") metal dome

Both drivers are magnetically shielded.

Weight: \[ 12.7 \text{ kg (28 lb)} \]

Dimensions:
- Height \[ 393 \text{ mm (15 1/2")} \]
- Width \[ 250 \text{ mm (9 7/8")} \]
- Depth \[ 290 \text{ mm (11 7/16")} \]

---

**CROSSOVER SECTION**

Input connector XLR female:
- pin 1 gnd
- pin 2 +
- pin 3 -

Input impedance: 10 kOhm balanced

Input level for 100 dB SPL output @ 1m:
- variable from +6 to -6 dBu

Input level for maximum short term sine wave output of 110 dB SPL @ 1m:
- variable from +16 to +4 dBu

Subsonic filter below 45 Hz: 18 dB/octave

Ultrasonic filter above 25 kHz: 12 dB/octave

Crossover frequency, Bass/Treble: 2.2 kHz

Crossover acoustical slopes: 24 dB/octave

Treble tilt control operating range in 2 dB steps:
- from -2 to -4 dB & MUTE

Bass roll-off control operating range in 2 dB steps:
- from 0 to -6 dB @ 80 Hz & MUTE

Bass tilt control operating range in 2 dB steps:
- from 0 to -6 dB @ 80 Hz & MUTE

The 'CAL' position is with all tone controls set to 'off' and the input sensitivity control to maximum (fully clockwise).

---

**AMPLIFIER SECTION**

Bass amplifier short term output power with an 8 Ohm load:
- 120 W

Treble amplifier short term output power with an 8 Ohm load:
- 120 W

Long term output power is limited by driver unit protection circuitry.

Amplifier system distortion at nominal output:
- THD < 0.05\%
- SMPTE-IM < 0.05\%
- CCIF-IM < 0.05\%
- DIM 100 < 0.05\%

Signal to Noise ratio, referred to full output:
- Bass > 100 dB
- Treble > 100 dB

Mains voltage: 230, 100/200 or 115/230V according to region

Voltage operating range: ±10\%

Power consumption:
- Idle 30 VA
- Full output 160 VA

---

**Figure 4.** The upper curve group shows the horizontal directivity characteristics of the 1031A in vertical configuration measured at 1 m. The lower curve is a 1/3 octave band power response, measured in an IEC approved reverberation chamber.

**Figure 5.** The curves show the effect of the bass tilt, treble tilt and bass roll-off controls on the free field response.
