

# UiPath™ Action Center

Scale your automations through seamless human-robot collaboration

UiPath Action Center enables automation of advanced processes that require robots and people to work together. Robots power through the work they do best. Humans step into the process to make required decisions including approvals, escalations and exceptions.

## What are the benefits of using Action Center?

Combine multiple processes into one

Choose how and when robots hand off actions

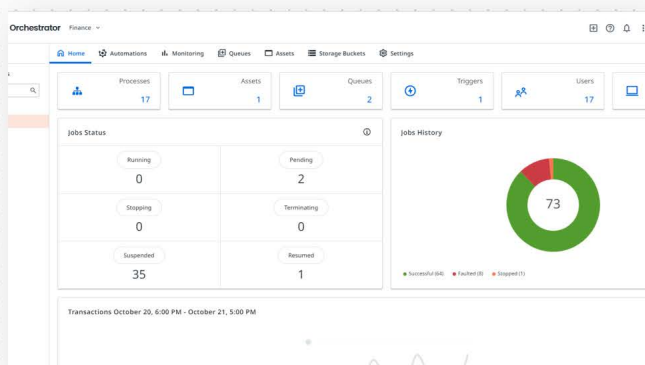

Monitor and manage processes from a portal

Define rules for approvals, escalations and exceptions

## Turn process fragmentation to seamless collaboration

### Automate long-running workflows

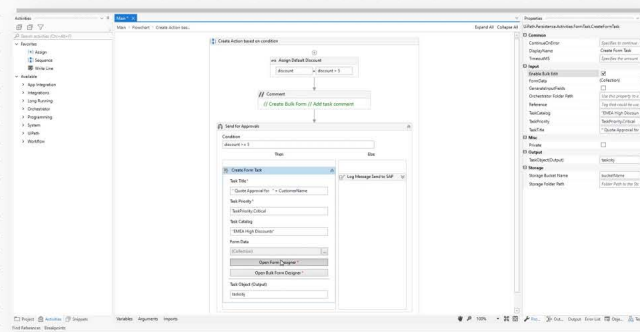

Many processes span across multiple days, business units, and require human inputs at various steps. They are hard to automate end to end.

Action Center gives you management tools to monitor processes from start to finish, identify, and resolve resource bottlenecks.

### Build robots that know when to start, pause...and resume

Easily build robots that handle the start-and-stop, come-and-go of robot and human interactions.

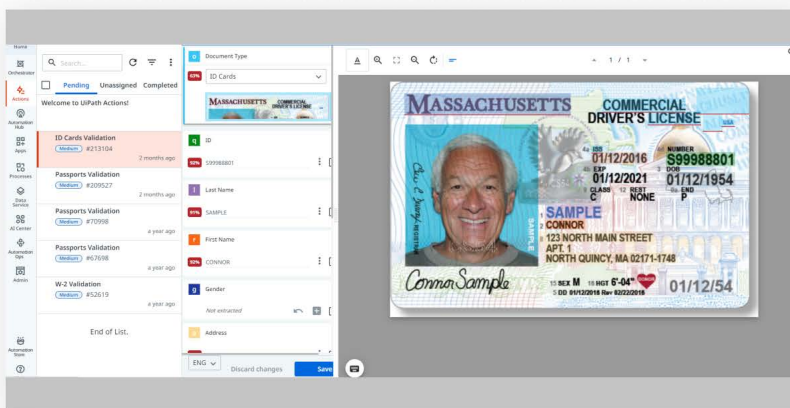

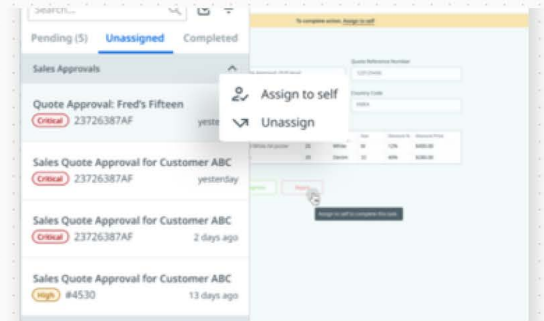

With Action Center, you robots can pause and resume work, drop off work to a person, efficiently keep busy with other jobs, and pick the job back up again. Unattended processes can be triggered through form-based inputs and file upload.

## Make it easy for humans to pick up the ball

Forget sifting through hundreds of emails—Action Center gives you a central portal where you can see (even from your mobile device) all actions and supporting documents. You can take actions including approvals, escalations and exceptions, or assign actions to your colleagues.

You can see actions grouped in three categories—Pending, Unassigned and Completed. You can bulk edit or complete multiple actions at one time.

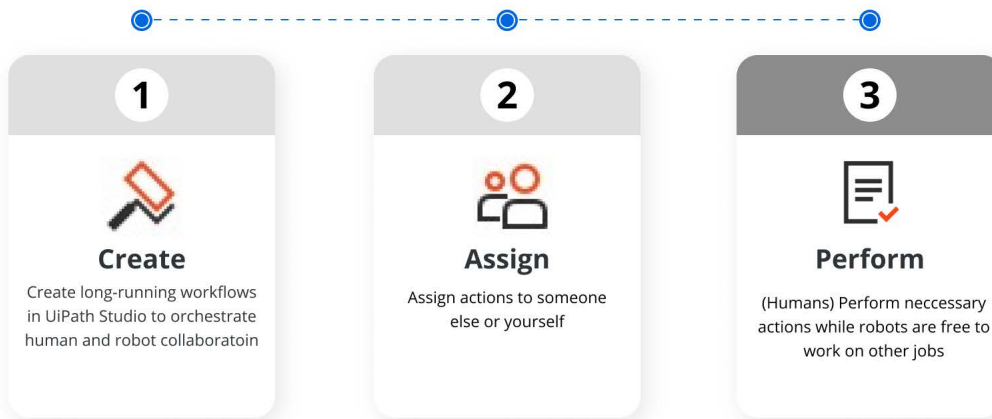

## Not just one product

Action Center integrates and works well Process Mining, Document Understanding, AI Center, and other UiPath products.

Monitor processes with Process Mining, proactively alert someone on unwanted behavior using Action Center. Use Document Understanding to process documents, and Action Center to bring humans in the loop for validation, and AI Center for retraining.

## How does Action Center work?

## Engage humans in the loop to scale your automations

UiPath Action Center is available via [UiPath Automation Cloud for Enterprise](#) and as an [on-premises solution](#).
