

UiPath Automation Cloud Security, Privacy, and Compliance

White Paper

Revised April 2023

Contents

Section 1	03	Introduction
Section 2	03	UiPath Automation Cloud – Services Overview
	04	Orchestrator
	04	AI Center
	04	Tenant Management Service
	04	Licensing Service
	04	Identity Service
Section 3	05	Service-Design Principles
	05	Data encryption
	05	Identity and access management
	05	Tenant data isolation
	05	Package integrity
Section 4	06	Privacy
	06	Data residency and sovereignty
Section 5	07	Security & Compliance Practices
	07	Systems hardening
	07	Live site testing
	07	Secure development life cycle
	07	Service and data availability
	07	Security incident response
	07	Production access control
	08	Secrets management
Section 6	08	Compliance – Certifications and Attestations
Section 7	09	Summary Overview

Introduction

UiPath Automation Cloud is a great deployment option for customers who want to start delivering automation quickly then scale up over time, with enterprise-scale manageability and optimization from day one.

The security of any and all data associated with your automation projects is of the upmost importance to UiPath, no matter whether you choose Automation Cloud or alternative options such as on-premises installation or deployment to a 3rd party cloud.

In this whitepaper, we focus specifically on the Automation Cloud service design principles and practices related to security, privacy, and compliance.

Our commitment

UiPath goes to great lengths to ensure that data related to your automation projects remains safe and secure. When using UiPath Automation Cloud, your data will benefit from multiple layers of security and governance technologies, operational practices, and compliance policies enforced by UiPath.

UiPath Automation Cloud – Services Overview

UiPath Automation Cloud is composed of multiple independent services, such as Cloud Portal, Tenant Management Service, Licensing Service, and Orchestrator, among others. The diagram below shows an example of how our cloud services interact with each other:

To provide a seamless experience, we work hard to abstract these details from the end user. Before delving into the details surrounding UiPath's approach to security, privacy, and compliance, we first need to provide some background about the key services in the Automation Cloud.

Remember, if you would like to try Automation Cloud for yourself, we invite you to try it out at any time with a 60-day free trial at uipath.com.

Cloud Portal

We offer our cloud services through a common front-end called the UiPath Cloud Portal. The portal serves as the first entry point for our customers when they create an account for their organization. As a customer, you can also:

- Invite or remove users
- Manage user roles and permissions
- Request licenses for robots
- Set up Orchestrator instance(s) for development, testing, and production needs

Orchestrator

The UiPath core platform's server-side component is called Orchestrator. It allows you as a customer to manage your entire RPA infrastructure from one central control plane. We provide a seamless experience for existing and new customers by integrating UiPath Orchestrator into the heart of our cloud offering. If you are a current on-premises or 3rd party cloud customer, you might be already familiar with the functionality and interface.

There are two variations of the Automation Cloud: community and enterprise. If you choose the free **UiPath Automation Cloud for community**, you receive a unique tenant on an Orchestrator instance shared with other customers. When you choose the more feature-rich **UiPath Automation Cloud for enterprise**, you can have multiple tenants within a single enterprise cloud instance, enabling you to manage multiple RPA environments from within your cloud. Although this instance is also shared with other enterprise customers, strict virtual separation ensures that no customer ever has access to any other customer's data or configuration.

Additional documentation on Orchestrator can be found [here](#).

AI Center

UiPath's cognitive services platform is called AI Center. AI Center allows Automation Cloud users to deploy and manage machine learning models within the Automation Cloud. RPA developers can easily integrate RPA automations with AI/ML models to extend a robot's ability to perform complex tasks. AI solutions templates provide building blocks for enhancing automations with AI, pre-built ML models, sample datasets, or analytics. You can quickly address use cases that benefit from AI models, such as document understanding, language analysis and comprehension, image analysis, or tabular data processing.

Additional documentation on AI Center can be found [here](#).

Tenant Management Service

Each customer is represented as a tenant in UiPath Automation Cloud. Each tenant can map their organization's internal structure and corresponding users using the tenant management capabilities. This offers you the flexibility needed for governance of RPA projects. The Tenant Management Service is decoupled from our portal and offers isolation in the backend while delivering a seamless user experience.

Licensing Service

The Licensing Service is the underlying mechanism that keeps track of licenses issued, activation status for robots, and run-time checks on usage. It is packaged as an independent service that interfaces with Cloud Portal, Orchestrator, and other services.

Identity Service

User identity is managed by a central identity service in UiPath Automation Cloud. Users sign into the system using either an external identity provider or through a UiPath Automation Cloud account. The UiPath Identity Service combines externally managed user identities with UiPath user and tenant information. The internal identity is used to identify users when they access the UiPath Automation Cloud, as well as to establish user identity between various components.

Service-Design Principles

All of the above services are packaged together as UiPath Automation Cloud and delivered via a Software-as-a-Service (SaaS) model that's built and hosted in Microsoft Azure. They all use core Azure services, including compute, storage, networking, SQL database, app configuration, secret storage in Key Vault, and identity and access management.

This allows UiPath to focus on the unique aspects of running and improving our services while taking advantage of, and building upon, Azure's state-of-the-art capabilities with regards to security, privacy, and compliance. We also utilize the industry certifications available through Azure.

At UiPath, we [share the responsibility of protecting your data with Azure](#), and strictly adhere to the guidance they publish.

Data encryption

We encrypt all customer data at-rest in any data store that is part of our service. For example, we use transparent data encryption in SQL databases. All data is transmitted over protected channels, whether it travels over the Internet or within our internal service components.

Identity and access management

We support account creation in Automation Cloud using a variety of identity service providers, such as Google, Microsoft, and LinkedIn, as well as through native accounts. After account creation, our services manage a given user's access rights using application-managed, role-based access control checks.

Our on-premises customers have long used Orchestrator's roles-based account control (RBAC). Thanks to tenant management in Automation Cloud, you have similar RBAC controls available in the cloud for a seamless experience when managing user roles and access.

Tenant data isolation

Data from each tenant is logically separated from others in our service so that we can enforce access and authorization controls for all tenants as they access data inside our service.

Package integrity

Ever since the 2019 fast-track release of our core platform, UiPath offers the possibility to [sign packages and workflows](#) that are uploaded into Orchestrator. As an aside, Automation Cloud customers automatically receive the latest updates approximately every 2 weeks, meaning our Automation Cloud customers also get this additional protection. You can publish packages to the UiPath-managed Orchestrator service in the Automation Cloud with confidence and not worry about package integrity and corresponding business impact should a server-side compromise occur.

Privacy

UiPath collects two categories of data from users in order to operate and improve Automation Cloud services:

1. **Customer data:** includes user-identifiable transactional and interactional data that we need to operate the service and to manage your contract with UiPath
2. **System-generated logs:** includes service-usage data that may be aggregated and contain pieces of customer data

From a GDPR standpoint, UiPath is considered a data processor. As such, we honor all obligations of a data processor by providing customers with full control over their data, in accordance with the product architecture and implementation. We have ensured that we can export all your data for you, upon request. Should you close your account with UiPath, or otherwise request data deletion, we delete that data from our systems after the requisite 30-day soft-delete period.

We recommend you to assess if your use of Automation Cloud is in line with your privacy obligations. For more information about UiPath's privacy statement, how UiPath processes your data when using online services, and GDPR commitments, please visit our [Privacy Policy](#).

Data residency and sovereignty

We know our customers care deeply about data location. We currently support six separate server regions: US, EU, Canada, Australia, Japan, and Singapore. Each region includes a fallback of high availability zone to allow for disaster recovery in the same geographic region.

Robot and business data associated with the free plan of UiPath Automation Cloud for *community* is stored in EU. Customers on the UiPath Automation Cloud for *enterprise* may choose the location of their tenants, and robot and business data is then stored in each tenant's region. By default, the location of services for enterprise cloud users is based on the location of the account: Japan for Japanese customers, Canada for Canadian customers, Australia for Australian and New Zealand customers, US for North American (excluding Canada) customers, and EU for the rest of the world. Customers can also request at any time that one or more of their tenants be moved to a different region.

We will serve all content (and store all robot and business data) from the region each tenant is hosted in. As demand grows, we may continue to add additional regions as options for enterprise cloud customers.

Please note also that although data from robots and business data is kept encrypted within the tenant region, some account-related data such as account name, user lists, and license information may be replicated outside the region as part of normal operations.

Security & Compliance Practices

UiPath addresses the following aspects of security and compliance in order to help prevent breaches and uphold the highest standards for data security, privacy, and availability:

Systems hardening

UiPath Cloud Services use Azure's Platform-as-a-Service (PaaS) offering for much of its infrastructure. PaaS automatically provides regular updates for known security vulnerabilities.

Live site testing

We emulate adversarial tactics on our services and underlying infrastructure using internal red teams. The goal is to identify real-world vulnerabilities, configuration errors, and other security gaps in a controlled manner so that we can test the effectiveness of our prevention, detection, and response capabilities.

Secure development life cycle

UiPath security and development teams work hand in hand to address security threats throughout the development process of UiPath Automation Cloud.

Teams perform threat modeling during service design. They adhere to design and code best practices and verify security in the final product using a multi-pronged approach that leverages internally built tools, commercial static and dynamic analysis tools, internal penetration testing, and external bug bounty programs.

We also monitor vulnerabilities introduced in our code base through third-party libraries and minimize our dependency on these libraries and corresponding exposure. Because the security landscape is continually changing, our teams stay current with the latest in best practices. We also enforce annual training requirements for all engineers and operations personnel working on UiPath Automation Cloud.

Service and data availability

It is of utmost importance to us to ensure Automation Cloud services are available for you to access your organization's assets. That is why we rely on Azure's backup mechanism and practice data recovery.

We employ other fail-safes to help ensure availability. A malicious distributed denial-of-service (DDoS) attack, for example, could affect UiPath Automation Cloud service availability. Azure has a DDoS defense system that helps prevent attacks against our service. It uses standard detection and mitigation techniques such as SYN cookies, rate limiting, and connection limits. The system is designed not only to withstand attacks from the outside, but also from within Azure.

Security incident response

We strive to minimize the attack surface of our services and go to great lengths to reduce the probability of a data breach ever occurring. Nevertheless, security incidents can still happen.

In the event of a breach, we use security response plans to minimize data leakage, loss, or corruption. We provide transparency to our customers throughout the incident. Our 24x7 SRE and Security team is always on hand to rapidly identify the issue and engage the necessary development team resources to contain the impact of the incident.

Once the team has contained an issue, our security incident management process continues as we identify the root cause and track the necessary changes to ensure we prevent similar issues in the future.

Production access control

We maintain strict control over who has access to our production environment and customer data. Access is only granted at the level of least privilege required and only after proper justifications are provided and verified. If a team member needs access to resolve an urgent issue or deploy a configuration change, they must apply for "just in time" access to the production service.

Access is revoked as soon as the situation is resolved. Access requests and approvals are tracked. If the username and password for one of our developers or operation staff were ever stolen, data is still protected because we use two-factor authentication for all production system access.

Secrets management

Secrets we use to manage and maintain the service, such as encryption keys, are managed,

stored, and transmitted securely through the Azure Management Portal. All secrets are rotated on a regular cadence and can be rotated on-demand if there is a security event.

Compliance – Certifications and Attestations

UiPath has obtained the ISO 27001:2013 certification (including alignment with the additional control sets for ISO 27017:2015 and ISO 27018:2019) for our information security management system (ISMS) and the ISO 9001:2015 certification for our quality management system (QMS). You can check our [Trust Portal](#) for reference. UiPath has also obtained a SOC 2® Type 2 report and HIPAA Type 2 that can be shared with customers and prospects under NDA. UiPath will continue to obtain SOC 2® Type 2 and HIPAA Type 2 reports indefinitely. Additionally, your UiPath representative can assist with any security architecture or capability questions not covered in this whitepaper.

Summary Overview

UiPath is committed to upholding the highest standards of data security, privacy, and compliance.

We live up to this mission through a combination of platform design, service-design principles, and security and compliance best practices. The culmination of these efforts is **UiPath Automation Cloud**, a solution that is as secure and reliable as it is cost-effective and scalable.

To learn more

If you have questions or concerns about our Automation Cloud security, privacy or compliance approach, your UiPath representative can assist in getting you any further information you may need from our team.

About UiPath

UiPath (NYSE: PATH) is on a mission to uplevel knowledge work so more people can work more creatively, collaboratively, and strategically. The AI-powered UiPath Business Automation Platform combines the leading robotic process automation (RPA) solution with a full suite of capabilities to understand, automate, and operate end-to-end processes, offering unprecedented time-to-value. For organizations that need to evolve to survive and thrive through increasingly changing times, UiPath is The Foundation of Innovation™.
