

Energy efficiency & renewable energy deployment statement

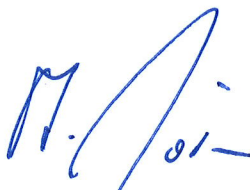

"Our ultimate goal is to shape a future in which energy efficiency is a matter of course for us, in which a significant part of the energy that we cannot save is generated ourselves and the remaining demand is covered by renewable energy sources!"

As a manufacturing company, we bear responsibility for protecting our planet. Ottobock has nine production sites worldwide. We are aware that our activities have an impact on the environment. For this reason, we work every day to make our production processes sustainable and minimise any impact. This includes, above all, the efficient and resource-conserving use of energy.

We are committed to reducing our energy consumption in the long term and to increasing our energy efficiency in a continuous improvement process.

The prerequisite for this is the implementation of an energy management system according to DIN EN ISO 50001. Successively, all production sites worldwide will be certified. The introduction of the management system helps us to critically question and improve processes. It enables us to keep an eye on changes and react accordingly - be it with regard to the development of more efficient technologies, the expansion of renewable energies, possible tax relief or changes in the legal framework.

In addition, the energy management system, with its efforts to achieve energy efficiency and the associated conservation of resources, forms an important component of the company-wide sustainability strategy.
