

The Network Intelligence Platform

Running modern networks is hard. Infrastructure teams must balance cost, security, and performance at ever-increasing complexity and scale. Now, more than ever, networks are a business critical asset. As traffic surges and AI redefines demands on network performance and reliability, the need for better network insights never been greater.

Revolutionize how networks are run

Kentik is the AI platform for intelligent network operations – built to meet the intensifying complexity of modern networks with actionable intelligence and agentic NetOps workflows. Design, operate, and optimize your networks to reduce cost, ensure performance, safeguard against risk, and increase profitability.

- **Network intelligence for every environment:** Real-time source of truth that understands every network in context – data center, hybrid-cloud, multi- cloud, campus, and branch.
- **Modern SaaS platform:** High performance, scalable platform to unify on-prem and multi-cloud traffic data, device health, synthetic tests, and state of the global internet in one place.
- **AI Advisor:** Your agentic teammate that thinks and works like a network engineer. Correlate telemetry and run investigations to surface insights and resolve incidents in seconds.

The Kentik Network Intelligence Platform

Kentik transforms traffic, device, performance, and internet data into action across every network, from rack to cloud to edge. Equipped with the Kentik Network Intelligence Platform, teams can proactively streamline infrastructure operations, ensure security and compliance, optimize and scale multi-cloud workloads, and resolve complex issues with speed and accuracy. Consolidate tools and empower engineers by bringing all network telemetry into one AI-powered SaaS platform.

AI Advisor

AI built by network experts for engineering teams makes it simple to quickly access and act on critical network insights.

Streamline investigations, troubleshooting, and resolutions in complex networks with high-context AI built to accelerate common engineering workflows.

Traffic Analysis

Best-in-class network traffic analysis helps you quickly identify and analyze traffic patterns down to specific endpoints.

Identify choke points and top talkers, even through overlay technologies, for better troubleshooting, capacity planning, and network design.

Network Health

Full visibility into network infrastructure health and performance, with unified metrics from both SNMP and streaming telemetry.

Troubleshoot and plan better with seamlessly integrated metrics and traffic insights in one extensible SaaS platform.

Network Performance

Detect issues before users do with synthetic tests of page and traffic performance.

Keep tabs on common SaaS apps and cloud services out-of-the-box, and automate custom tests from agents around the world.

Multi-Cloud Observability

Empower teams to answer any question about cloud traffic, connectivity, or performance.

Understand hybrid cloud connectivity and health. See public cloud performance, uptime, and connectivity. Check live connectivity between any instance, subnet, or network interface on demand.

Network Security

Quickly spot anomalies and suspicious traffic with metadata-rich traffic telemetry in a high-performance data engine.

Detect DDoS, refine cloud security policies, catch botnets, stop route leaks, and prevent BGP hijacking with global network visibility.

World-class operations for enterprise networks

Kentik is the network intelligence platform for modern infrastructure teams. Unlike traditional monitoring and observability tools, we demystify complex network operations, enabling organizations to deliver applications — and innovation — at scale.
