Legacy DATA WAREHOUSE Modernization

The Key to Futureproof BI

According to a survey,

58% of people recognize the importance of modernizing a data warehouse.

Data warehouse modernization (DWM) is the next step in the evolution of data management.

Legacy data architectures with traditional data stacks lack the ability to solve data challenges.

DWM is fast becoming a top priority for organizations looking to gain faster, more in-depth insights and create more effective customer experiences.

The Potential Benefits Of Modernizing Data Warehouse With Cloud

89% of people consider data warehouse modernization an opportunity.

SCALABILITY

The cloud horizontally scales the data out in order to meet the growing needs of analytics.

This helps users to focus more on analytics instead of worrying about data migration.

INTEGRATION

Uploading data into a cloud warehouse and diving into analytics is fast and inexpensive.

This reduces the system dependence on integrators and capital expenditures for hardware.

AVAILABILITY

The cloud has high availability along with handling all upgrades and patches.

This shifts the focus of data warehouse professionals in development and analytics.

LOW TOTAL COST

Start-up costs and maintenance of physical data platforms are far more than cloud environments.

It gives a data warehouse speed with minimal planning and administrative work.
