

## TOURBILLON

---

The Tourbillon was originally created to be the world's most mechanical timepiece. The escapement and balance wheel of the Tourbillon are housed in a small cage that rotates continuously, and it is this tiny 'clock within a clock' that actively counteracts the effects of gravity on the watch movement, allowing it to attain chronometer-like accuracy.

Even with today's advanced technology, the Tourbillon can only be built by the most skilled watchmakers. Each Michael Hill Tourbillon is meticulously engineered and then hand assembled.

### KEEPING PERFECT TIME:

The Michael Hill Tourbillon movement is hand wound; an elegant reminder to owners that time is precious and should never be ignored.

When winding your Tourbillon, rotate the winding crown in a clockwise direction until you feel it start to tighten, then cease winding. Over winding may damage the movement.

Your Tourbillon is a masterpiece of design and delicate engineering; please take care when wearing it.

Dial positions and layout of the face might vary depending on the watch model.
