

Creating Custom Fields

Bitwarden Essential Series

Custom Fields

- Custom fields allow you to store up to 5,000 characters in additional spaces in any Item type (Login, Card, Identity, Secure note).
- You can select from one of four types to create a custom field.

Custom Text Fields

- Custom text fields display the information directly. These are ideal for non-sensitive pieces of information.

Name	Value
Text Custom Field	My Text

The image shows a dark-themed table with two columns: 'Name' and 'Value'. The 'Name' column contains the text 'Text Custom Field'. The 'Value' column contains the text 'My Text'. To the right of the 'Value' cell, there are two icons: a copy icon (two overlapping squares) and a minus sign icon (a circle with a horizontal line through it).

Custom Hidden Fields

- Custom hidden fields display the information, obfuscated (hidden) and require the use of the reveal (eye) button to show them.
- These are best used for sensitive information that you would prefer not to have visible by default.

The image displays two screenshots of the Bitwarden interface, illustrating the state of a custom hidden field. Both screenshots show a dark-themed input area with a 'Name' field containing 'Hidden Custom Field' and a 'Value' field. The top screenshot shows the 'Value' field as a series of dots, indicating it is hidden. A red eye icon is highlighted with a blue box, representing the 'reveal' button. The bottom screenshot shows the 'Value' field containing the text 'Hidden Value', indicating the field is now visible. The red eye icon is now crossed out, and the blue box highlights the 'Hidden Value' text.

Custom Boolean Fields

- Custom boolean fields store a simple **true** or **false** value, represented by a checkbox.
- Boolean fields can be used to fill a variety of forms and selections.

Name	Value
<input type="text" value="True Boolean Field"/>	<input checked="" type="checkbox"/>
<input type="text" value="False Boolean Field"/>	<input checked="" type="checkbox"/>

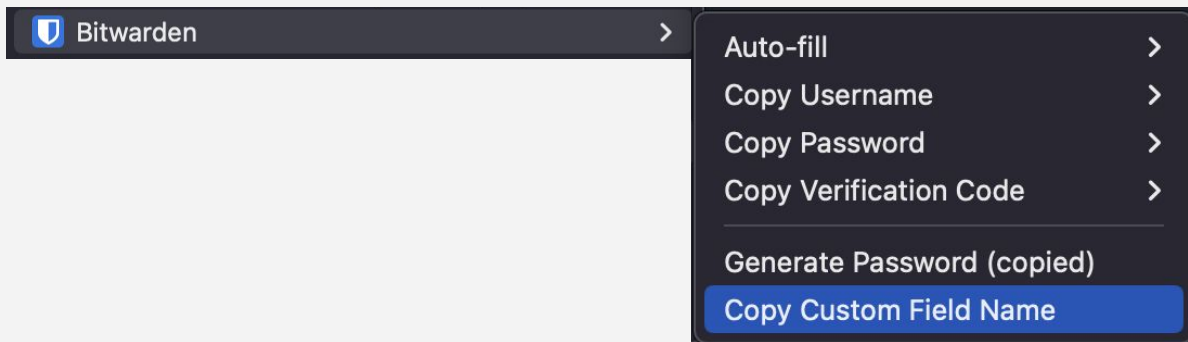

Custom Linked Fields

- Custom fields can be added in all clients (Web Vault, Desktop, Mobile apps and CLI)
- Simply use the **Edit** option and you'll be able to add a custom field.

Name	Value
<input type="text" value="Linked Custom Field"/>	<input type="text" value="Username"/> 
<input type="text" value="Linked Custom Field"/>	<input type="text" value="Password"/> 

Naming a Custom Field

- For most custom fields, you can name them whatever you would like.
- To autofill a custom field, it will need to match an element on the web page.
- To accomplish this, right click in your browser, select Bitwarden in the menu, and select **Copy Custom Field Name** and paste the value into your new custom field name.
