

THE ZYGOMATIC PATIENT

Treatment Protocols for Immediacy

The evaluation of patients for immediate loading who have with terminal dentition, especially in the maxilla, may at times be challenging. This presentation will discuss and showcase simple pre-operative techniques to predictably evaluate the type of final prosthesis needed for this group of patients. Patients generally are presented with treatment plans to undergo removal of their teeth followed by several months of wearing a nonfunctional full denture as the alveolar ridge heals. This is an uncomfortable phase of their treatment and therefore, many patients who may be presented with this treatment option chose not to have any form of treatment performed.

In this presentation, several cases will be shown to demonstrate the efficacy of immediate loading the terminal dentition patient eliminating the denture wearing phase. This presentation will outline an efficient and predictable treatment protocol allowing for a higher case acceptance by the patient with terminal dentition.

This presentation will:

- Introduce the Zones of the maxilla
- Present the factors to consider when placing axial, tilted, reversed tilted and the zygoma implant in reconstruction of the edentulous maxillae
- Discuss the algorithm to achieve adequate insertion torque
- Review preoperative determination of the reasons and the technique for alveoloplasty prior to implant placement
- Review the SRA abutment and its role in the immediate conversion of the patient's denture to a fixed provisional
- Understand evolutions in zygomatic implant designs

SPEAKER
Dr. Edmond Bedrossian

AUDIENCE
Clinicians experienced in zygomatic procedures

FORMAT
Virtual presentation

DATES
Mar 20, 2021
April 24, 2021
May 15, 2021

TIME
11:00 am EST-3:00 pm EST

TOTAL CE HOURS
4

1. Understanding the Pre-treatment evaluation protocol for the patient with terminal dentition.
2. Understanding the preoperative discussions with the laboratory for the fabrication of the immediate denture needed for the conversion to a fixed provisional prosthesis.
3. Understanding the sequence of the surgical treatment for immediate implant placement including tilted and the Zygoma implant.
