Trial Units

The E-mag Active Diagnostic Orthosis is designed to determine suitability of a KAFO controlled by the E-mag Active joint (StanceControl Orthosis) for people suffering from leg paralysis. This diagnostic orthosis is only intended for a functional test and does not replace the individual trial fitting. The objective is to assess whether or not a KAFO controlled by E-mag Active is the appropriate brace for the patient.

Ottobock Australia offers 1 week free patient trials, in addition to 1 week travel time to and from Sydney (2 weeks total). A loaner fee of \$150 applies for each week the unit is outstanding after this time.
