Acorn Planting a better future

*100.000+
Farmers supported*

*Projects globally
15+*

*Fair farmer payments
80%*

*250.000+
CRUs sold*

At Acorn, we help smallholder farmers, offset carbon and work towards climate balance - all at once.

Acorn and its local partners help smallholder farmers in developing countries transition to agroforestry - where trees grow among other crops, leading to better soil quality and more sustainable farming.

Once the newly planted trees have grown and sequestered enough carbon, each tonne is sold to responsible corporates as

Carbon Removal Units (CRU).

The best part is this: 80% of the sales price flows back to the farmer, 10% goes to local partners and 10% is for Acorn. Always.

Our system has created an extra stream of income for thousands of farmers in Africa, Asia and Latin America. It drives the transition needed to a more climate-resilient way of farming that improves livelihoods, biodiversity and social progress. It is a step towards the climate balance we all need.

Nature-based carbon credits

The growth of the trees is measured with satellite imagery, AI and LiDAR, and certified by ICROA-accredited Plan Vivo. We are trusted by partners like Microsoft and Standard Chartered. We can show you the exact plot of land and farmer where the CRU comes from.

A triple win

This is one of those rare occasions where everything falls into place. Our carbon credits are quantifiable, available at scale and proven – making

good on climate promises. The smallholder farmers and their communities benefit in a structural way. All the while working towards a sustainable climate balance for all of us.

This time, truly everybody wins.
