DEMONSTRATED PROTOCOL

Cell Surface Protein Labeling for Single Cell RNA Sequencing Protocols with Feature Barcode technology

Overview
Cell surface proteins can be labeled using a specific protein binding molecule, such as an antibody conjugated to a Feature Barcode oligonucleotide. This protocol provides guidance for antibody-oligonucleotide conjugation and outlines cell surface protein labeling for use with Single Cell RNA sequencing protocols with Feature Barcode technology for cell surface protein. This protocol also provides guidance for enriching labeled cells using Fluorescence Activated Cell Sorting (FACS).

Additional Guidance

Cells carry potentially hazardous pathogens. Follow material supplier recommendations and local laboratory procedures and regulations for the safe handling, storage and disposal of biological materials.

Preparation – Buffers
Buffers
Prepare fresh, maintain at 4°C

PBS + 1% BSA
Alternatively, Cell Staining Buffer from BioLegend can be used for labeling.

PBS + 0.04% BSA
PBS + 2% FBS (Only if performing FACS enrichment of labeled cells)

*TotalSeq™-B for: Single Cell 3’ v3 and v3.1 protocol with Feature Barcode technology for Cell Surface Protein

*TotalSeq™-C for: Single Cell 5’ v1, v1.1 & v2 protocol with Feature Barcode technology for Cell Surface Protein & Antigen Specificity.

*Choose different clones than antibody-oligonucleotide conjugates
Protocol Overview

**Option A. Custom Conjugated Antibodies**

Follow manufacturer’s instructions (Abcam Oligonucleotide Conjugation Kit) for conjugation and purification

**Option B. Preconjugated Antibodies**

BioLegend TotalSeq™-B
OR
BioLegend TotalSeq™-C

1. **Label Cells** Prepare Antibody Mix & FACS Antibody Pool (if performing FACS enrichment) as described in the Labeling Protocol

<table>
<thead>
<tr>
<th>Cells in PBS + 0.04% BSA</th>
<th>Remove supernatant</th>
<th>400 rcf, 5 min, 4°C*</th>
</tr>
</thead>
</table>

   Resuspend in PBS + 1% BSA (50 μl)
   Add TruStain FcX (5 μl)
   Gently pipette mix

   Incubate for 10 min (4°C)

   Add Antibody Mix Supernatant**
   Add PBS + 1% BSA
   Gently pipette mix

   Incubate for 30 min (4°C)

   Proceed to Wash Cells

*Centrifugation conditions are sample-type dependent

**If performing FACS enrichment, add prepared FACS Antibody Pool

2. **Wash Cells**

<table>
<thead>
<tr>
<th>Add PBS + 0.04% BSA (3.5 ml)</th>
<th>Gently pipette mix</th>
<th>400 rcf, 5 min, 4°C*</th>
</tr>
</thead>
</table>

   Remove supernatant

   Wash 1:
   Add PBS + 1% BSA
   400 rcf, 5 min, 4°C*
   Gently pipette mix

   Remove supernatant

   **Fragile Cells:** Skip PBS resuspension & room temperature incubation; proceed directly to Wash 2 and transfer the cells to a new tube after adding 3.5 ml PBS + 1% BSA.

   Wash 2:
   Add PBS + 1% BSA (3.5 ml)
   Gently pipette mix

   Incubate at room temperature (5 min)

   Wash 3 & 4: Repeat 2x

   Yes
   Resuspend in PBS + 2% FBS (include a dead cell marker)
   Proceed to FACS

   No
   Resuspend in PBS + 1% BSA
   Count labeled cells

   Proceed to 10x Genomics Single Cell protocols with Feature Barcode technology

*Centrifugation conditions are sample-type dependent
Antibody-Oligonucleotide Conjugation Guidance

Choose antibody based on cell surface protein/s being labeled and a Feature Barcode oligonucleotide compatible with specific 10x Genomics protocol (Table 1) for conjugation. Alternatively, use compatible preconjugated antibodies from BioLegend or other vendors for labeling cells.

Oligonucleotide:

- Use ≥10 nmole HPLC-purified and lyophilized Feature Barcode oligonucleotide for conjugation. The oligonucleotide must contain an amine group at 5'-end (5'-amine modified; IDT code /5AmMC12/).
- Resuspend lyophilized oligonucleotide in PBS or other compatible buffer (see Oligonucleotide Conjugation Kit) at 100 µM, i.e. 10 nmole dissolved in 100 µl buffer.

DO NOT use Tris buffers for resuspension as they are not compatible with conjugation.

Conjugation:

Follow manufacturer’s instructions (Oligonucleotide Conjugation Kit from Abcam) for antibody-oligonucleotide conjugation. Abcam Oligonucleotide Conjugation Kit is compatible with many purified antibodies.

Antibody-Oligonucleotide Ratio:

This protocol was demonstrated using 1:3 antibody-oligonucleotide ratio for conjugation. Optimization may be needed depending on the antibodies used.

Conjugate Purification:

The antibody-oligonucleotide conjugate purification is recommended to remove any unbound oligonucleotides. Follow the Conjugate Purification protocol (Abcam).

Verification of Conjugation:

Verify the conjugation by comparing the antibody-oligonucleotide conjugate with an unconjugated antibody control resolved on a non-reducing, gradient SDS-PAGE gel.

Run a known volume and concentration of unconjugated antibody next to a known volume of antibody-oligonucleotide conjugate on SDS-PAGE gel.

Estimate the conjugate concentration and calculate the degree of conjugation by comparing the respective band intensities.

See Appendix for an illustrative overview of antibody-oligonucleotide conjugate capture by 10x Gel Bead primers. Consult Barcode Whitelist for Custom Feature Barcode conjugates (Document CG000193), for more information.
Cell Surface Protein Labeling Protocol

This protocol was optimized using TotalSeq-B/C antibody-oligonucleotide conjugates from BioLegend. The labeled cells were enriched by FACS (see Appendix).

Use distinct antibody clones for FACS and cell surface protein labeling. Optimize working concentration of each of the antibodies used.

1. Label Cells

This protocol was demonstrated using 0.2-1 x 10⁴ cells. Wash cells according to the appropriate 10x Genomics Demonstrated Protocol for the cell type being prepared. All steps can be performed in 5-ml centrifuge tubes.

Prepare Antibody Mix Supernatant:
- Add appropriate/manufacturer’s recommended amount of antibody-oligonucleotide conjugates to a 1.5-ml microcentrifuge tube.
- Centrifuge the mix at 14,000 rcf for 10 min at 4°C.
- Transfer the supernatant (containing Antibody Mix) to a new tube and maintain at 4°C.

Prepare FACS Antibody Pool:
- Add appropriate/manufacturer’s recommended amount of fluorophore antibodies to a 1.5-ml microcentrifuge tube on ice.
- Gently pipette mix and maintain at 4°C. Avoid light exposure.

a. Transfer cells to a new 5-ml tube and add chilled PBS + 0.04 % BSA for a total 1 ml volume.

b. Centrifuge cells at 4°C. Use of swinging-bucket rotor is recommended for higher cell recovery. Centrifugation speed and time depends upon the sample type. Larger or fragile cell types may require slower centrifugation speeds. Use the following table for guidance.

c. Remove the supernatant without disturbing the pellet.

d. Resuspend cell pellet in 50 μl chilled PBS + 1% BSA.

e. Add 5 μl Human TruStain FcX. Gently pipette mix.

f. Incubate for 10 min at 4°C.

g. Add the prepared Antibody Mix supernatant. If also performing FACS enrichment, add FACS antibody pool.

h. Add chilled PBS + 1% BSA to the cells to bring the total volume to 100 μl. Gently pipette mix 10x (pipette set to 90 μl).

i. Incubate for 30 min at 4°C. If using FACS antibodies, incubate without light exposure.

2. Wash Cells

Thorough washing of cells post labeling is critical to obtain high-quality data. Optimization of centrifugation speed/time may be needed based on cell type.

a. Wash 1: Wash by adding 3.5 ml chilled PBS + 0.04% BSA to the cells from step 1i. Gently pipette mix.

b. Centrifuge at 4°C. Centrifugation speed and time depends upon the sample type. Use Table 2 for guidance.

c. Remove the supernatant without touching the bottom of the tube to avoid dislodging the pellet.

Leaving behind excess supernatant may cause non-specific binding, which may result in increased background reads during sequencing.

d. Resuspend the pellet in 100 μl room temperature PBS and transfer to a new 5-ml tube. Incubate for 5 min at room temperature. Proceed to step e (Wash 2).

Step d can be excluded for the fragile cells (see Cell Washing for Fragile Cell Types in Appendix) to maximize cell health and recovery. If not performing step d, proceed directly to step e (Wash 2) and transfer the cells to a new tube after adding 3.5 ml PBS + 1% BSA in step e.

e. Wash 2: Using a pipette tip, resuspend the pellet or cells in 3.5 ml chilled PBS + 1% BSA.

f. Centrifuge at 4°C. Centrifugation speed and time depends upon the sample type. Use Table 2 for guidance.

g. Remove the supernatant without touching the bottom of the tube to avoid dislodging the pellet.

h. Washes 3 & 4: Repeat e - g 2x for a total of three washes.

i. OPTIONAL For enrichment of labeled cells by FACS:
Based on starting concentration and assuming ~50% cell loss, add an appropriate volume chilled PBS + 2% FBS (including a dead cell marker) to obtain a final cell concentration of 5-10 x 10⁴ cells/ml and proceed to FACS (see FACS Guidance).

After FACS, determine cell concentration and viability using a Countess II Automated Cell Counter or a hemocytometer and proceed immediately to relevant Chromium Single Cell RNA Sequencing protocols with Feature Barcode technology (see References).

j. If not performing FACS:
Based on starting concentration and assuming ~50% cell loss, add an appropriate volume chilled PBS + 1% BSA to obtain a concentration of 700-1,200 cells/μl. Determine cell concentration and viability using a Countess II Automated Cell Counter or a hemocytometer and proceed immediately to relevant Chromium Single Cell RNA Sequencing protocols with Feature Barcode technology (see References).
Appendix

Illustrative Overview of Wash Steps

To eliminate non-specific binding with comparable efficiency, wash steps may be performed in 5-ml microcentrifuge tubes using indicated buffer volumes. Non-specific binding contributes to increased background reads during sequencing.

Wash Steps in 5-ml Microcentrifuge Tubes

*Exclude these steps for fragile cells (See Cell Washing for Fragile Cell Types) and proceed directly to Wash 2 and transfer the cells to a new tube after adding 3.5 ml buffer.

Cell Washing for Fragile Cell Types

PBS resuspension and room temperature incubation (step 2d) during cell wash can be excluded for fragile cell types. The exclusion of this step may yield slightly lower Cell Surface Protein library metrics, but will preserve cell health and recovery. Step 2d can be excluded in the following sample types:

- Cell types with low viability (<70%)
- Sample types that are known to degrade quickly
- Samples with very low cell input (<200,000 cells)

FACS Guidance

Enrich labeled cells using FACS prior to library generation to enable identification of rare subpopulations.

FACS Cell Collection

It is recommended to collect FACS enriched cells in up to 20% FBS to maintain cell viability. Cells should be collected either in 20 µl volume in the collection tube/plate (96-well plate) or in 200 µl volume in a 1.5-ml tube.

The sort stream should be adjusted so that the cell-droplet falls into the collection buffer. Sorted cells must be counted and viability measured before proceeding to the 10x Genomics Single Cell protocols. If necessary, the collected cells may be concentrated by centrifugation at 350 rcf at 4°C and by removing the supernatant.

Cell loss during FACS is common. Optimize the protocol steps accordingly.

Once sorting is complete, proceed immediately to relevant Chromium Single Cell RNA Sequencing protocols with Feature Barcode technology (see References).
Antibody-oligonucleotide conjugate capture by protocol specific Gel Bead primers is illustrated below.

### Compatible Primers

To generate Cell Surface Protein libraries with TotalSeq-B/C, use the primers indicated below.

<table>
<thead>
<tr>
<th>Antibody-Oligonucleotide Conjugate</th>
<th>Compatible Primers</th>
<th>10x PN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TotalSeq-B</td>
<td>Feature cDNA Primers 2</td>
<td>2000097</td>
</tr>
<tr>
<td>TotalSeq-C</td>
<td>SC5' Feature cDNA Primer/Feature cDNA Primer 4</td>
<td>2000119/2000277</td>
</tr>
</tbody>
</table>

If generating libraries with TotalSeq™-A, an additive primer is required for successful amplification (not provided by 10x Genomics). See Cite Seq Protocols and BioLegend for details.
