

## Case study

# Fleet management system

**The opportunity:** MMT was brought in to revitalize a failing initiative central to BP's European fleet digital transformation, costed at £20mn.

**What we did:** Working closely with BP, we developed a market-leading fleet card portal, re-platforming and re-engineering the legacy business management system. We used Lean Agile practices guided decisions, with real users onboarded to test and refine ideas rapidly.

To support this transformation, we implemented a robust domain-oriented microservice and API layer, translating complex business logic and large datasets into industry-standard Restful API endpoints to streamline data access and innovation. While consolidating delivery pipelines into Azure Stack. This enabled continuous delivery, reducing release cycles from once in two years to just 2-4 weeks.

Domains covered: user management, customer management, card management, transactions & invoices, data & reports.

**The results:** "MMT Digital have had a fantastic impact on the programme in a short space of time. Their experience of agile delivery in a complex enterprise has had a measurable increase in valuable outcomes. We are excited to see where the partnership can take us." TJ Nicolson - Head of Product - bp
