

Clinical Skills

3 Steps to Improve the Nursing Experience

Nurse leaders can ease burnout factors for nurses and positively impact their daily routines.

32% of registered nurses say they might leave their direct patient-care role.¹

How nurse leaders can make a difference:

ONE:

Give back valuable time through evidence-based skills and procedures integrated into the EHR workflow.

90% of nurses do not have enough time to properly care for patients.²

Help nurses **save time and be more effective** by providing clinical skills guidance within the EHR, where they spend up to 50% of their time.³ Easy access to information right within their workflow can support efficient and accurate patient care.

TWO:

Personalize guidance to help your nurses make confident decisions at the bedside.

960 Nurses make roughly 960 decisions in an average eight-hour shift...one every 30 seconds!⁴

Proactively surface relevant skills and procedures based on the specific patients, diagnoses, and orders within each nurse's shift. Providing nurses with a **tailored workflow experience** helps support confident decision-making.

THREE:

Use actionable insights to pinpoint where nurses need support, education, and guidance.

WHEN, WHERE & HOW Nurse leaders need to know exactly when, where, and how to optimize nursing performance.

Provide data and insights that make it easier to identify nurses' knowledge gaps, create more **targeted education and training**, and drive more consistent use of evidence-based skills and procedures.
