## MasterFlux I300

### Project description

Grouting of 5 wind turbines, Vestas VII0 - 2MW

### Challenge

Grouting works and hardening of the grout under very cold conditions, without risking to delay the project installation progress.

The design of the grouted connection required for the grout material to be placed at large thickness.

### Solution

The rapid hardening properties of MB Flux I300 allowed for the installation in the adverse conditions, and swift continuation of the grout installation under the 5 turbine structures.

The volume stable and shrinkage compensated formulation of the material, permitted for the MB Flux I300 grout to be placed at the required large thickness.

The installation by our Approved Grouting Contractor, ACC Bau, was a reassurance to Vestas of good quality grouting works.
