

MasterAtlas™ - Quality Control Data Capture

Construction is an industry driven by data, whether it pertains to engineering specifications or the concrete mixture development process. DATA MATTERS. Unlike opinions, data objectively tells the story of what has occurred or what is expected to happen. But what if users had clear, easy-to-use data for their concrete production?

Users become informed and trusted advisors.

The Problem: test data is often recorded on paper, then either manually entered into a QC software program later or, in some cases, not collected or entered at all.

- What if a concrete producer does not have a QC software program?
- What if the tickets are misplaced?
- What if the data is not entered due to time constraints?

Although not a complete quality control software program, MasterAtlas was designed to simplify and expedite the data capture and retrieval process. The mobile application allows field personnel to enter fresh property data, compressive strength data, and

notes directly on their devices. This data is linked to the batch via ticket number and is immediately accessible to the entire team on both mobile devices and desktop interfaces.

The MasterAtlas Virtual Assistant actively monitors this data and facilitates dynamic notifications. Additionally, custom dashboard reports can be created based on user preferences. Performance data is directly linked to batch results, moisture levels, and job site weather conditions, providing holistic insights and control.

Real results from real users using MasterAtlas Quality Data Capture

- This feature has made field technicians more efficient and effective, saving both time and money.
- Dashboard reports are generated for the calibration of in-truck sensors, confirming the accuracy of sensor technology and enhancing its credibility and value.
- For those without a Quality software program, MasterAtlas offers a basic system for digitally collecting and storing data for future use and analysis.
