

# Portable Noise Monitoring Terminal Report

## February 2026

Revision 1 - Value updated on pages 8 and 11

---

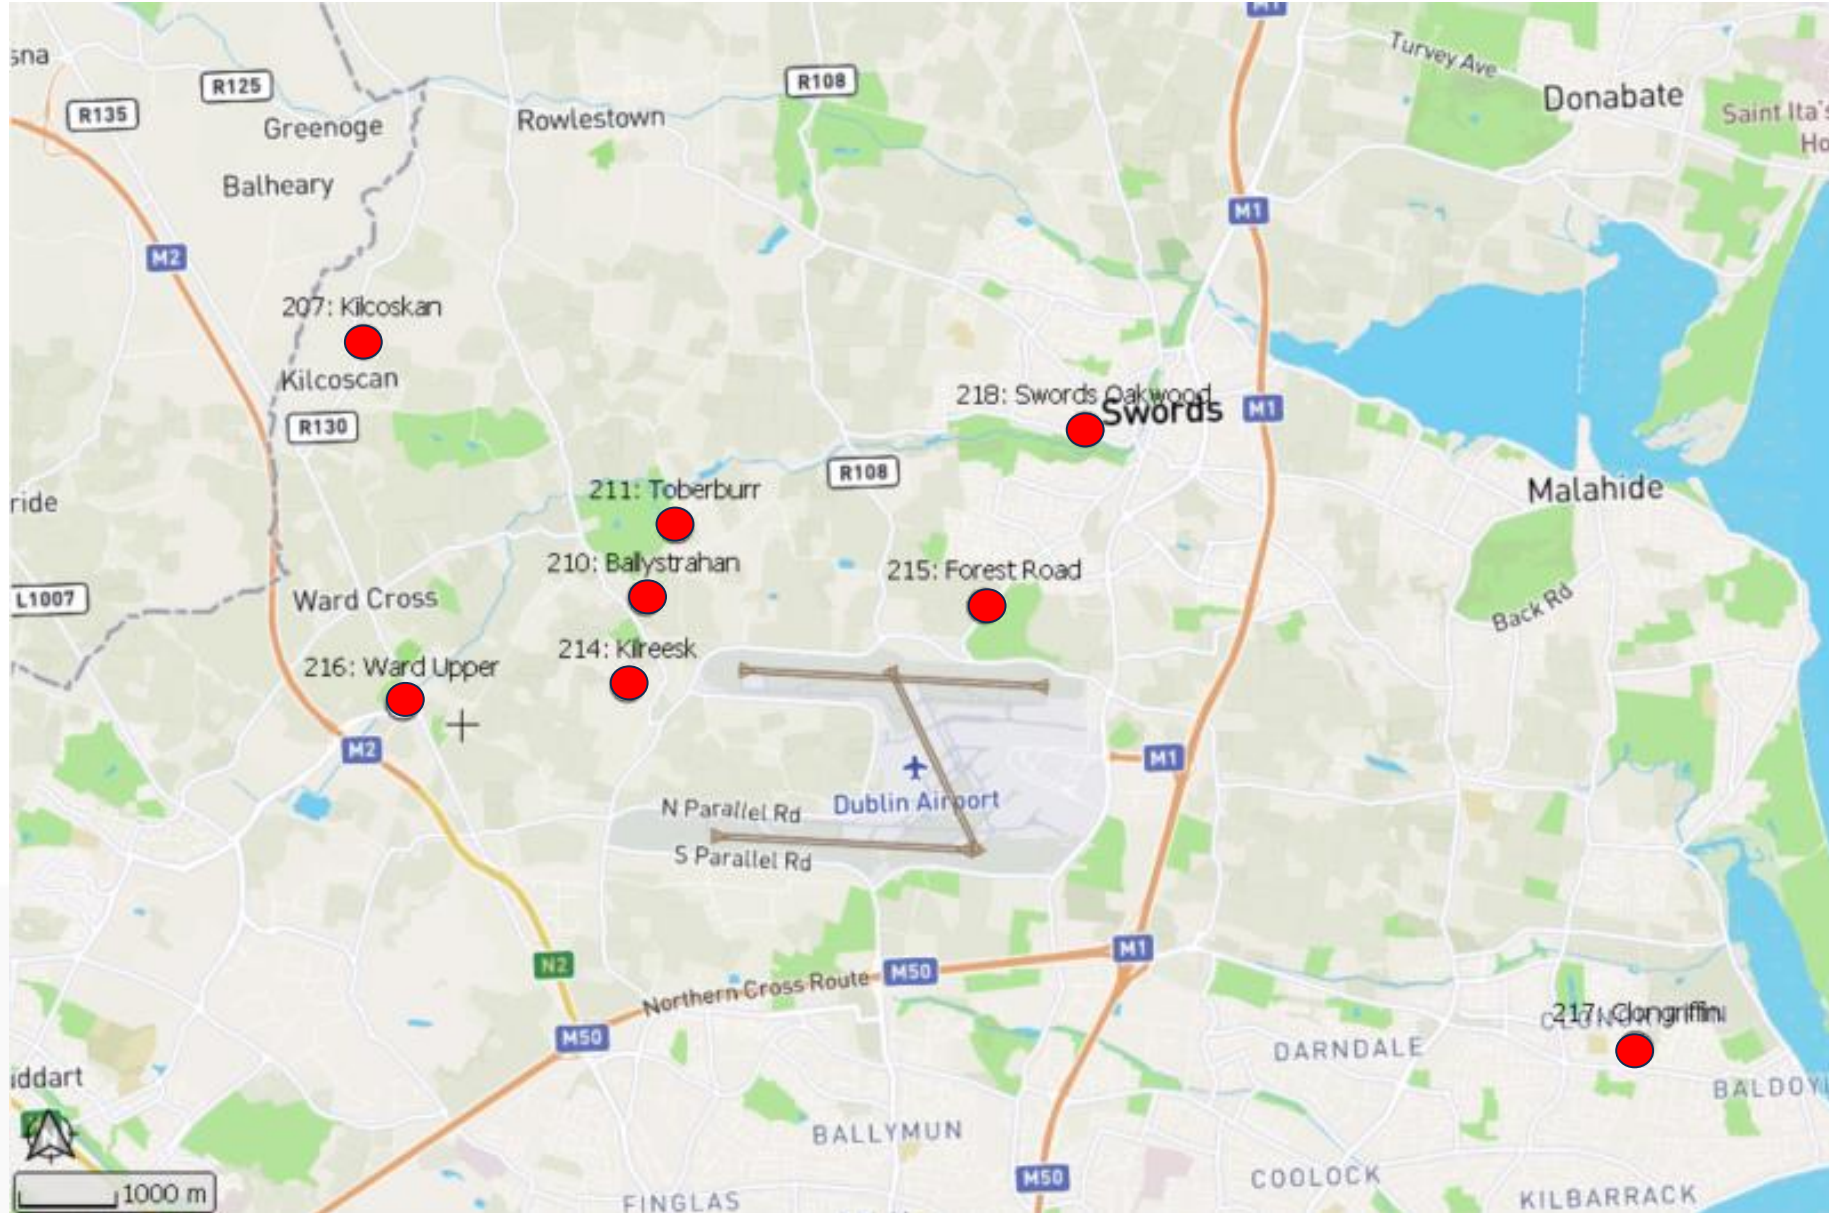

- This report presents aircraft noise data collected from Dublin Airport’s Portable Noise Monitoring Terminals (NMTs) at nine community locations around the airport. Portable NMTs are used to gather short-term, location-specific noise data and compliment the Airport’s network of permanent noise monitors.
- The data in this report covers measurements taken at various locations between August 2024 and February 2026. Results from earlier portable deployments have been reported previously in Dublin Airport’s quarterly Noise and Flight Track Monitoring Reports.
- Five different noise metrics are used in this report. These include three time-averaged metrics (Lden, Lnight, and Leq16h) and two single-event metrics (Lmax and SEL). Lden and Lnight are required under the EU Environmental Noise Directive and are normally assessed over a full calendar year. In this report, they are presented over shorter monitoring periods to reflect the temporary nature of portable installations.
- Single-event metrics such as Lmax and SEL are not typically used on their own to assess noise impact. However, when combined with information on the number and frequency of events, they provide additional insight into how aircraft noise is experienced at different locations.
- International standards (ISO 20906:2009+A1:2013) recommend that aircraft noise monitoring microphones be installed at a minimum height of six metres to reduce the effect of noise reflections off the ground and hard surfaces. Microphones installed at a lower height can report slightly higher noise levels.
- Some portable NMTs were installed at heights of around 1.5 metres (Kilcoskan, Rivervalley and and Ballystrahan) however equipment upgrades mean that microphone heights are now at four metres. This does represent a compromise, as full six metre installations would require Planning Permission even for a short-term installation. As a result, portable monitors may slightly over-report noise levels.

Term	Definition
<b>NMT</b>	NMT means Noise Monitoring Terminal. They are generally located in community areas. An NMT includes a high-quality, calibrated microphone and provides continuous noise level data at the location of the NMT.
<b>Correlated Aircraft Noise Event</b>	This is a noise event that is matched to an aircraft flight near the location of the NMT and the time of the noise event. Only correlated aircraft noise events are used to calculate the measured aircraft noise (e.g. Lden, Lnight, Leq16) at the NMT location.
<b>Lden</b>	Lden is the day-evening-night level. It is a descriptor of noise level based on energy equivalent noise level (Leq) over a whole day or longer, with a penalty of 5 dBA for evening noise (19:00-23:00h or 7-11pm) and a penalty of 10 dBA for night-time noise (23:00-7:00h or 11pm-7am). The 5-decibel penalty means that an evening flight is treated as the equivalent of three daytime flights. The 10-decibel penalty means that a night flight is the equivalent of 10 daytime flights.
<b>Lnight</b>	Lnight is the night-time (11pm-7am) Leq average noise indicator. Like Lden, in this document, Lnight is reported monthly, quarterly and annually.
<b>Leq</b>	Leq is the Equivalent Continuous Sound Level and is the average sound level, over the given period, that has the same total energy as the actual time-varying noise.
<b>Leq16(hr)</b>	Leq16h is the Leq over the 16-hour day-time period (7am-11pm). The Summer Leq16hr covers the 92 days from mid-June to mid-September and, at Dublin Airport, is used for assessing the Residential Noise Insulation Scheme.
<b>Lmax</b>	Lmax is the maximum instantaneous noise level recorded at an NMT during a noise event. Leq1sec (approx. Lmax) is displayed at each NMT on the Dublin Airport WebTrak site however, it also <u>includes</u> non-aircraft noise.
<b>SEL</b>	SEL or Sound Exposure Level represents the total noise energy contained in a noise event, as if the same noise energy were compressed into a single second. For a short event (like a single dog bark) the SEL is approximately the same value as the Lmax. For an aircraft noise event, usually 10 to 30 seconds, the SEL value is typically about 10 decibels higher than the Lmax. The SEL values of the Correlated Aircraft Noise Events are added up and used to calculate average noise level metrics over longer periods, including annual or monthly Lden & Lnight, or monthly or summer Leq16 & Leq8.

Term	Definition
<b>Noise Event</b>	A noise event is detected at an NMT location when the noise level rises above and then falls below a pre-set threshold level. This can be caused by many different sources including aircraft, vehicles on a road, dogs barking, wind, sirens etc.
<b>Number Above (NA)</b>	Number Above is a single event metric unlike Lden or Lnight which are time-averaged noise metrics. N60 is the number of (aircraft noise) events with Lmax ≥ 60 dBA. N(SEL)70 is the number of (aircraft noise) events with SEL ≥ 70 dBA. Note that N60 value includes the events in N65, N70 and higher.
<b>Time-Averaged noise levels</b>	Including Annual Lden and Lnight and Summer Leq16/8h, averaged noise levels allow the comparison of different locations around an airport, (and also other airports) where aircraft types, power settings, overflight frequency, operational time of day, and tracks heights vary. The EU and WHO uses Lden and Lnight to assess the total impact on communities for road, rail and air transport noise.
<b>Total Noise</b>	Total Noise is a measure of noise from all noise sources (including aircraft and non-aircraft activity) during the period. This means that Aircraft Noise cannot exceed Total Noise. In this report, Total Lden measurements are presented for the purpose of comparison with the measured Aircraft noise Lden.

**Note:** Portable NMT's were installed at Millhead, Boraimhe and Lusk at varying times between October 2023 and September 2024. Data results from these portable monitors were reported in Dublin Airport's Q2 and Q3 Noise and Flight Track Monitoring Report published on our website. Data from NMT that were installed at Rivervalley (Swords), Wotton, Mabestown were published in the previous Portable Noise Monitoring Terminal Report.
