

RSB Application

RELEASE NOTES

About the RSB Application

The RSB (Router Status Broadcast) application is an AirLink container application that allows broadcasting of selected router status information (including WAN, GNSS, VPN, and general status details) over UDP at regular intervals, when WAN states change, or both. These release notes describe a known issue that applies to the first release of the application.

Sierra Wireless has tested and validated the RSB application release 1.0 (rsb:1.0-9e98e4a) on AirLink XR80 and XR90 routers running AirLink OS 5.0. The application is available from gallery.ecr.aws/airlink/rsb.

Known Issue

An issue exists where non-default LAN segments cannot be applied via a template. The container runs on the Default LAN segment after a template is applied no matter which LAN Segment is specified in the template.
