

ALEOS 4.4.0b Release Notes

The ALEOS 4.4.0b release is for AirLink ES440, GX Series and LS300 devices. Refer to the ALEOS Software Configuration User Guide for update instructions.

There are no new features in ALEOS 4.4.0b.

Bug Fixes

DMNR

The DMNR feature now includes the option to allow packets that exceed the maximum transmit unit (MTU) size of routers in the network path to be fragmented and sent, rather than being dropped.

User Interface

ACEmanager now displays the phone number and APN correctly after activation on the Sprint network.

SMS

Fixed SMS character-encoding issue, whereby under certain conditions the SMS encoding would be sent using the incorrect format.

Stability

Resolved a platform stability/lock-up issue that had required a device reboot to remedy. This fix prevents the lock-up from occurring.
