CENTAFLEX-A AT A GLANCE

The CENTAFLEX-A presents itself as a versatile superstar when it comes to coping with sophisticated misalignment compensation, fail-safe decoupling of torsional vibrations and reliable electric insulation. Complete with maximum design flexibility.

As the bestseller among all of CENTA's couplings, it is based on a highly elastic rubber element with an integrated fail-safe device that allows for adequate and appropriate application designs. The element is available in a variety of materials and different degrees of Shore hardness. This enables the torsional flexibility of the couplings to be adapted with utmost variability to the specific application. It features a radial-axial screwing concept, unique in this market, and simplifies the mounting of these couplings significantly.

The CENTAFLEX-A is available in a number of different designs as a coupling or a drive shaft (steel, carbon-fibre or glass-fibre designs) as well as in axially plug-in design. Quick replacement of the low-maintenance rubber element is made possible by a split-design replacement element for radial mounting. Combined with a wide range of adapters, flanges, and hubs, the CENTAFLEX-A adapts optimally to each installation thereby guaranteeing seamless coverage for torques up to 12.5 kNm.

Features

- High flexibility in all directions
- High adaptability to torsional flexibility
- High design flexibility
- Fail-safe device integration

Areas of application

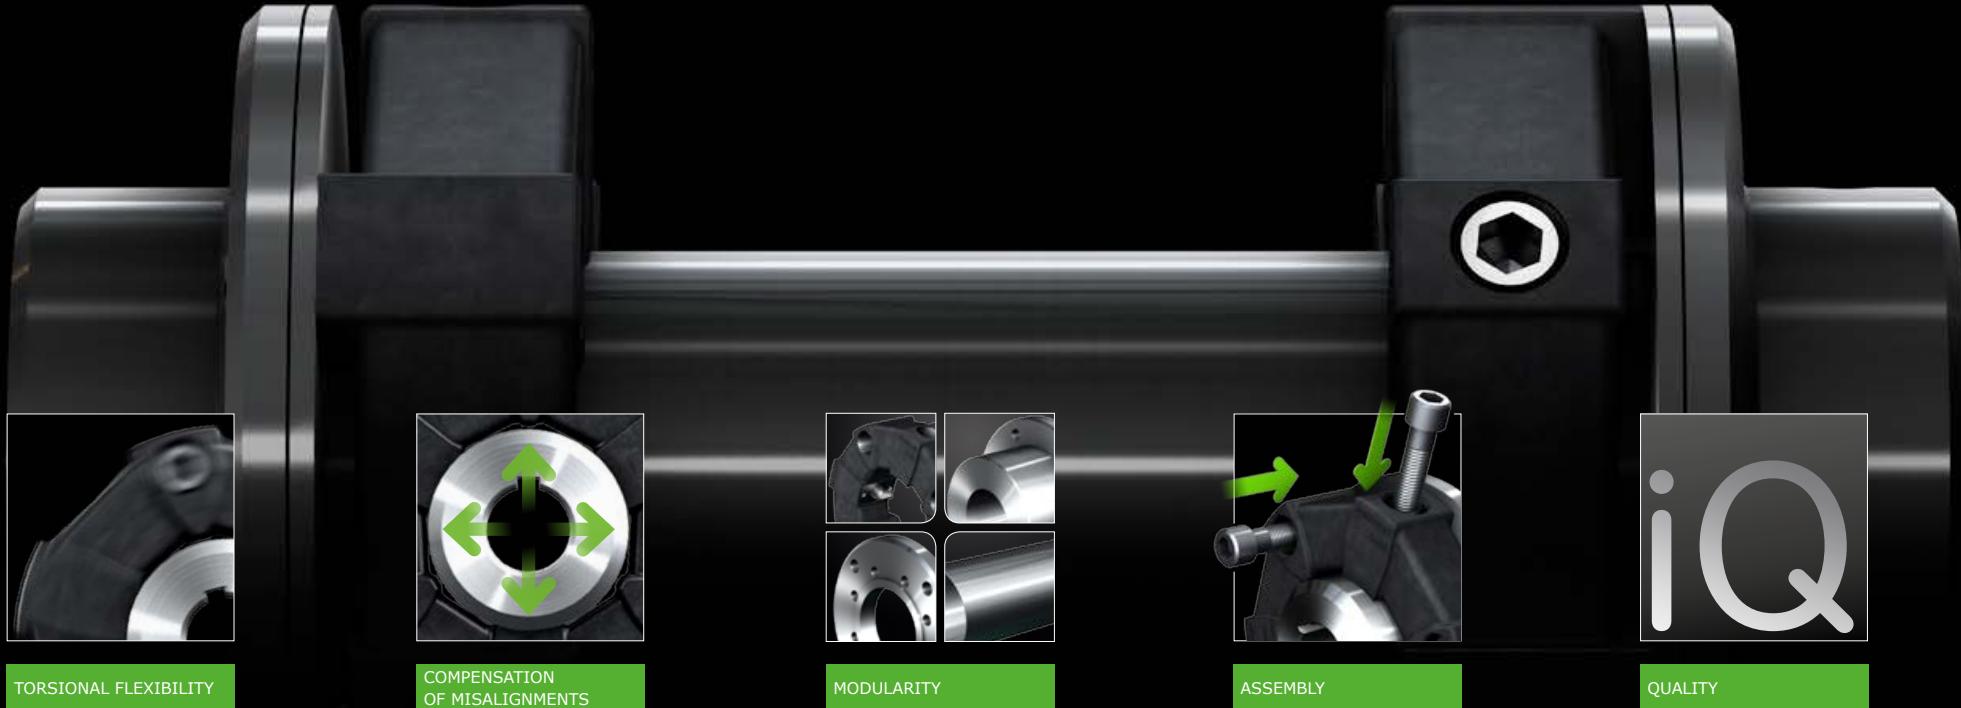

Torque range

0.01 to 12.5 kNm

For safe transmission of high torques and long lifespan with maximum design flexibility

LEADING BY INNOVATION

The rubber elements for the CENTAFLEX-A are available in different degrees of Shore hardness. This enables the torsional flexibility of the couplings to be adapted with utmost variability to the specific application. Torsional vibrations and impacts are reliably dampeden.

The couplings of the CENTAFLEX-A series compensate for significant misalignments in axial, radial and angular directions. They are the ideal solution for applications with demanding misalignments.

The rubber element of the CENTAFLEX-A enables an adequate and appropriate design solution for practically any application with very little effort. The versatile superstar among the CENTA products is available as a coupling and as a drive shaft (steel, carbon fibre or glass-fibre design). Combined with a wide range of adapters, flanges and hubs, the CENTAFLEX-A can be customized to any kind of mounting and application condition.

The axial-radial screwing connection for the CENTAFLEX-A, unique in this market, eases the assembly significantly; moreover, it ensures the application of pre-pressure on the rubber columns and is advantageous for the performance capabilities and service-life of the coupling. In addition, all designs are available as plug-in versions for axial assembly. Quick replacement of the low-maintenance rubber element is guaranteed due to a split version of the rubber element, which is assembled radially.

When the going gets tough, quality is priceless. With an exemplary Quality Management, CENTA ensures products that withstand the roughest assignments. CENTA's coupling systems are more than the sum of their parts. CENTA entertains the vision of intelligent products that meet the highest requirements in terms of design and quality.

CENTAFLEX-A

COMPONENTS ADAPTATION

CENTAFLEX-A COMPONENTS

RUBBER ELEMENTS

The CENTAFLEX-A rubber elements are made of high-quality natural rubber or of silicone – for use at very high ambient temperatures – and feature vulcanized jaws for fastening to the drive side resp. power take-off side. By covering the jaws in the circumferential direction, the coupling elements are fail-safe.

The axial-radial screwing connection for the CENTAFLEX-A, unique in this market, eases the assembly significantly; moreover, it ensures the application of pre-pressure on the rubber columns and is advantageous for the performance capabilities and service-life of the coupling.

The CENTAFLEX-A rubber elements are available in various designs either as a screw-type or as an axially plug-in version. To allow quick replacement of the low-maintenance rubber element, we offer a split version of the rubber element, which is assembled radially.

CENTAFLEX-A ADAPTATION

HUBS

We offer all standard connections, such as evolute splines, flange connections, clamping sets, keyway connections and oil press fits. In addition, CENTA has developed the CENTALOC clamping hub, a shaft-hub-connection, which is completely free of backlash and has proven itself in thousands of applications. The clamping system prevents wear and tear due to fretting corrosion or deflection of the gearing and is available for all CENTAFLEX-A couplings.

FLANGES

The CENTAFLEX-A is available for all SAE flywheels as well as for non-standard flywheels. Flanges can be obtained for all connections and can be adapted to any existing drive or PTO elements as desired.

TUBES

The homokinetic version of the CENTAFLEX-A can be delivered in any requested length and thereby adapted to specific mounting conditions. Short shafts are made with tubes of round steel, longer shafts (up to 6 metres and special designs of even greater length) are bridged by a thin-walled precision steel tube.

In addition, CENTA has developed light-weight drive shafts made of carbon-fibre reinforced plastic. The rigidity and stability is comparable to steel, but the weight is significantly less, which is an advantage especially for bend-critical applications. For applications which require extremely high insulation values, the CENTAFLEX-A can be delivered with a glass-fibre tube.

TORQUE LIMITERS

Load holding torque limiters are available for all CENTAFLEX-A designs, suitable for mounting either in the middle tube as well as on the generator shaft. Supplied with pre-set slip-through torque and individual calibration protocol.

CENTAFLEX-A

TYPES

Which product for your purpose?

We will gladly assist → www.centa.info/contact

CENTAFLEX-A

TYPES

Coupling
Type 0 and 0-S

Rubber element on which the Type series is based. Made of high-quality natural rubber or silicone and available in various degrees of Shore hardness.

Type S for plug-in assembly.

Coupling
Type 1 and 1-S

Rubber element with hub for drive resp. power take-off side. For connection to already existing drivetrain elements such as flywheels, pulleys or brake discs, friction or turbo clutches, freewheel clutches, cogwheels, etc.

Type S for plug-in assembly.

Coupling
Type 2 and 2-S

Rubber element with hub for drive resp. power take-off side. Intended for all applications in general mechanical engineering.

Type S for plug-in assembly.

Coupling
Type 3 and 3-S

Rubber element with simple flange plate, which can be adopted to any standard and non-standard flywheel as well as any other element. Suitable for combustion engines and other applications.

Type S for plug-in assembly.

Drive shaft
Type G / GB / GZ

Highly flexible drive shaft, available in any desired length and with variable connection elements that can be customized to any kind of mounting and application condition. Extremely versatile and cost-effective type. Suitable for low torques and small distances.

For applications with high torques and large distances, the shafts feature additionally an accurate, low maintenance centering of the intermediate tube. CENTA always considers the individual operating conditions before choosing a type.

CENTAFLEX-A DRIVE SHAFTS

CENTAFLEX-A drive shafts in various lengths, adaptable to the installation requirements if applied as homokinetic shaft. Also available as carbon-fibre or glass-fibre designs and with split element. Easy handling and mountable with minimum effort. Dampens torsional vibrations and shocks and compensates considerable axial, radial and angular misalignments.

TYPE G

The simplest design type; the centre part is centered only by the elements. Suitable for short and medium lengths and for speeds up to approx. 1500 min^{-1} .

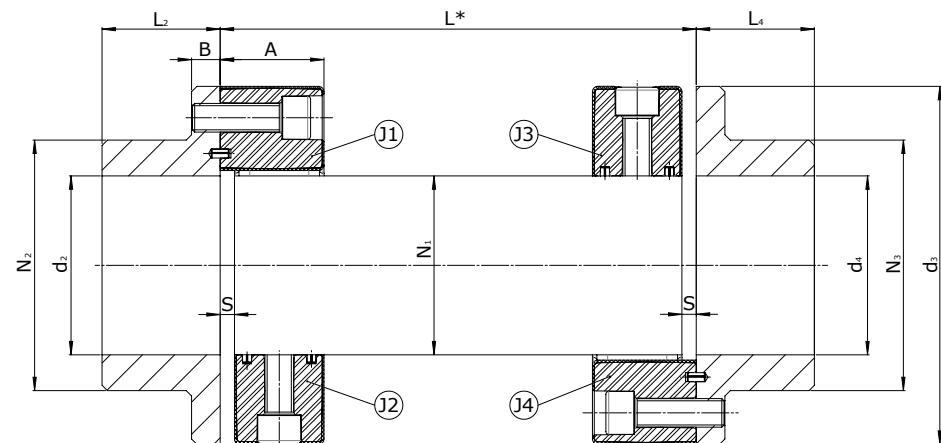

TYPE GB/GZ

Accurate, low maintenance centering of the central part for applications with very high speeds and/or long shaft length.

CENTAFLEX-A

EXPLANATION OF THE TECHNICAL DATA

1	2	3	4	5	6
Size	Rubber quality Shore A	Nominal torque T_{KN} [kNm]	Maximum torque [kNm]	Continuous vibratory torque T_{KW} [kNm]	Permissible Power Loss P_{KV} [kW] or [W]
This spontaneously selected figure designates the size of the coupling.	This figure indicates the nominal shore hardness of the elastic element. The nominal value and the effective value may deviate within given tolerance ranges.	Average torque which can be transmitted continuously over the entire speed range.	<p>T_{Kmax}</p> <p>This is the torque that may occur occasionally and for a short period up to 1.000 times and may not lead to a substantial temperature rise in the rubber element.</p> <p>In addition the following maximum torques may occur:</p> <ul style="list-style-type: none"> $\Delta T_{Kmax} = 1,8 \times T_{KN}$ $T_{Kmax1} = 1,5 \times T_{KN}$ $T_{Kmax2} = 4,5 \times T_{KN}$ 	<p>T_{KW}</p> <p>Amplitude of the continuously permissible periodic torque fluctuation with a basic load up to the value T_{KN}. The frequency of the amplitude has no influence on the permissible continuous vibratory torque. Its main influence on the coupling temperature is taken into consideration in the calculation of the power loss.</p> <p>T_{Bmax}</p> <p>The maximum operating torque results of T_{KN} and T_{KW}.</p>	<p>S_{PVK}</p> <p>Damping of vibrations and displacement results in power loss within the rubber element.</p> <p>The permissible power loss is the maximum heat (converted damping work into heat), which the rubber element can dissipate continuously to the environment (i.e. without time limit) without the maximum permissible temperature being exceeded.</p> <p>The given permissible power loss refers to an ambient temperature of 30° C. If the coupling is to be operated at a higher ambient temperature, the temperature factor S_{PVK} has to be taken into consideration in the calculation.</p> <p>The coupling can momentarily withstand an increase of the permissible power loss for a short period under certain operation modes (e.g. misfiring).</p> <p>P_{KV30}</p> <p>For a maximum period of 30 minutes the double power loss P_{KV30} is permissible. CENTA keeps record of exact parameters for further operation modes.</p>

CENTAFLEX-A

EXPLANATION OF THE TECHNICAL DATA

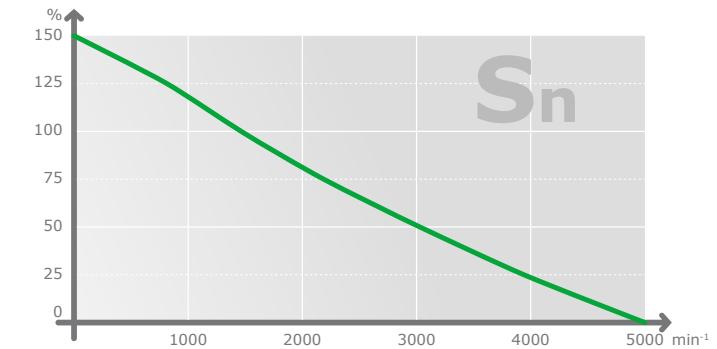

7	8	9	10
Dynamic torsional stiffness $C_{T\text{dyn}}$ [kNm/rad]	Relative damping ψ	Speed $[\text{min}^{-1}]$	Permissible axial displacement [mm]
<p>The dynamic torsional stiffness is the relation of the torque to the torsional angle under dynamic loading.</p> <p>The torsional stiffness may be linear or progressive depending on the coupling design and material.</p> <p>The value given for couplings with linear torsional stiffness considers following terms:</p> <ul style="list-style-type: none"> Pre-load: 50% of T_{KN} Amplitude of vibratory torque: 25% of T_{KN} Ambient temperature: 20°C Frequency: 10 Hz <p>For couplings with progressive torsional stiffness only the pre-load value changes as stated.</p> <p>The tolerance of the torsional stiffness is ±15% if not stated otherwise.</p> <p>The following influences need to be considered if the torsional stiffness is required for other operating modes:</p> <ul style="list-style-type: none"> Temperature Higher temperature reduces the dynamic torsional stiffness. Temperature factor $S_{CT\text{dyn}}$ has to be taken into consideration in the calculation. Frequency of vibration Higher frequencies increase the torsional stiffness. By experience the dynamic torsional stiffness is 30% higher than the static stiffness. CENTA keeps record of exact parameters. Amplitude of vibratory torque Higher amplitudes reduce the torsional stiffness, therefore small amplitudes result in higher dynamic stiffness. CENTA keeps record of exact parameters. 	<p>The relative damping is the relationship of the damping work to the elastic deformation during a cycle of vibration. The larger this value [ψ], the lower is the increase of the continuous vibratory torque within or close to resonance. The tolerance of the relative damping is ±20%, if not otherwise stated. The relative damping is reduced at higher temperatures.</p> <p>Temperature factor S_{ψ} has to be taken into consideration in the calculation. The vibration amplitude and frequency only have marginal effect on the relative damping.</p>	<p>The maximum speed of the coupling element, which may occur occasionally and for a short period (e.g. overspeed). The characteristics of mounted parts may require a reduction of the maximum speed (e.g. outer diameter or material of brake discs).</p> <p>The maximum permissible speed of highly flexible coupling elements is normally 90% thereof.</p>	<p>The continuous permissible axial displacement of the coupling. This is the sum of displacement by assembly as well as static and dynamic displacements during operation.</p> <p>The maximum axial displacement of the coupling, which may occur occasionally for a short period (e.g. extreme load). The concurrent occurrence of different kinds of displacements is handled in technical documents (displacement diagrams, data sheets, assembly instructions).</p>
ΔK_a	n_{max}	n_d	$\Delta K_{a\ max}$

CENTAFLEX-A

EXPLANATION OF THE TECHNICAL DATA

11	12	13	14	15
Axial stiffness [kN/mm]	Permissible radial displacement [mm]	Radial stiffness [kN/mm]	Permissible angular displacement [°]	Angular stiffness [kNm/°]
C_a The axial stiffness determines the axial reaction force on the input and output sides upon axial displacement.	ΔK_r The continuous permissible radial displacement of the coupling. This is the sum of displacement by assembly as well as static and dynamic displacements during operation. The continuous permissible radial displacement depends on the operation speed and may require adjustment (see diagrams S_n of the coupling series).	C_r The radial stiffness determines the radial reaction force on the input and output sides upon radial displacement. C_{rdyn} By experience the dynamic stiffness is higher than the static one. The factor depends on the coupling series.	ΔK_w The continuous permissible angular displacement of the coupling. This is the sum of displacement by assembly as well as static and dynamic displacements during operation. The continuous permissible angular displacement depends on the operation speed and may require adjustment (see diagrams S_n of the coupling series).	C_w The angular stiffness determines the restoring bending moment on the input and output sides upon angular displacement. C_{wdyn} By experience the dynamic stiffness is higher than the static one. The factor depends on the coupling series.
$C_{a\ dyn}$ By experience the dynamic stiffness is higher than the static one. The factor depends on the coupling series.	$\Delta K_{r\ max}$ The maximum radial displacement of the coupling, which may occur occasionally and for a short period without consideration of the operation speed (e.g. extreme overload). The concurrent occurrence of different kinds of displacements is handled in technical documents (displacement diagrams, data sheets, assembly instructions).		$\Delta K_{w\ max}$ The maximum angular displacement of the coupling, which may occur occasionally and for a short period without consideration of the operation speed (e.g. extreme overload). The concurrent occurrence of different kinds of displacements is handled in technical documents (displacement diagrams, data sheets, assembly instructions).	

CENTA is the leading producer of flexible couplings for rail, industrial, marine and power generating applications. Worldwide.
