

DevOps: Design to Implementation in Big Enterprise

**Oliver Hookins
Nokia**

**What's it all about?
Trust.**

What is the right approach?

- Communication

- Technological solutions

**Know your weaknesses.
Know your destination.
Collect metrics.**

Key Ingredient #1
Good, technical managers.

**Aim to solve problems
previously addressing
misconceptions.**

**Be prepared to embrace
software development.**

**Attack rigid change
management with
aggressive testing.**

Embrace failure.

**Programmatically enhance
communication between
silos.**

If that can't be done, fail back to acceptable (but still improved) defaults.

Keep metrics!

**Streamline handovers
between teams using
software tooling.**

Prioritise bug fixes and preventing downtime.

**Encourage use of software
development ideologies
e.g. Agile/Scrum/Kanban.**

Give regular demos.

Use CI tools for testing and visualisation.

**Break down work into
small, modular units.**

**Know when to cede
territory to the “enterprise
solution”.**

APIs.
Make them, use them.

Version your APIs.

DevOps in the Enterprise is possible!

**If anything I've said interests you,
please come and talk to me about it!**
