

Aptean Ross Data Manager

Easily archive data and retrieve information with robust data management for Ross ERP

With Ross Data Manager, you can evaluate data pertaining to your daily operations and use that to examine trends and activities that guide informed decisions about the future. As time passes, some of the historic data loses its significance but remains in the system creating unintended negative effects on performance, storage requirements, system maintenance, and upgrades.

Ross Data Manager is designed to allow management of historical data in a more efficient manner, putting you in control of your ERP data instead of the other way around. The biggest benefits of archiving data include:

Improved ERP Performance and Response Time

Archiving ERP data helps control the size of your database and ensures that only significant and relevant information is utilized.

Increased Benefits when Upgrading

Process data faster and reduce production conversion downtime during the upgrade cycle.

Reduced Processing Time

As less data is being queried for reports and other functions, fewer server resources are required to handle requests.

Reduced Total Cost of Ownership

Store archived data on another server so your resources required for backups and production disk space don't have to grow with the size of your database.

Key Features

- Ross Data Manager simplifies the process of data archiving by defining data to be archived by cut-off date and record status. All of this can be done with zero downtime.
- Archiving includes transaction trees for AP, AR, GL, DC, IC, and Sales modules for quick access.
- Archive either by year, or by period and year.
- This process is repetitive, Key allowing you to archive repeatedly, appending to your archive based on your organization's individual needs and desired filter criteria.
- You may host the archive database on a different server location and provide activity logs before making a final commit.
- Performs data validation during the archive process while ensuring open transactions are not archived.
- Maintain referential integrity without the user needing to know the relationships/constraints to use the tool.
- Archive user-defined custom tables, and also add custom tables and fields to standard dependencies.
- Add custom algorithms to the archive using non-standard filters.
- Ross Data Manager activities are logged to provide a history of the data processed for later verification and validation.
- The security of the archive is maintained in the same manner and with the same settings as your production database.

Manage your data, instead of letting your data manage you. Aptean Professional Services has experts in data archiving and Aptean Ross Data Manager and can train your team on best practices for data archiving and the operation of the toolkit.
