Congressional District Health
DASHBOARD

Using data to improve the health of all people.

Until now, most data on health and the drivers of health and wellbeing have not been widely available at the congressional district level, nor were they easily accessible to the public. That's where the Congressional District Health Dashboard comes in.

The Congressional District Health Dashboard compiles local data from multiple national sources for all 435 U.S. congressional districts and D.C., and enables users to:

Explore district-level data on health, education, poverty, and more.

Map and use compelling visualizations to identify local or national gaps and advocate for change.

Identify racial, ethnic, geographic, and other disparities in health across congressional districts.

Compare the health status and drivers of health in districts with state and national averages.

Using Data to Drive Change

This powerful, first-of-its-kind tool can help lawmakers, advocates, journalists, and others dig into congressional district-level data, identify priorities, and drive action. For example:

▶ **Policymakers** can advocate for federal legislation to target funding and other supports to congressional districts with the highest child poverty or uninsured rates.

▶ **Advocates** can show lawmakers how their district compares to others on cancer deaths or access to healthy foods.

▶ **Journalists** can use district-level data to answer important health-related questions about the topics or districts they cover, and enrich stories on policy news of the day.

▶ **Researchers** can leverage data on disparities to understand the impact of policies on health and health equity.
> *The Congressional District Health Dashboard will help policymakers understand the influence of factors that affect health and communities' ability to thrive, such as diabetes, physical inactivity, rent burden, and access to broadband connection.*
