Migraine is one of the most prevalent diseases in the world and the number two leading cause of disability worldwide.7

Despite its prevalence, migraine remains under-diagnosed and under-treated.13

The burden of migraine impacts individual patients and society as a whole.4

Fortunately, a wave of innovation in the field of migraine treatment has yielded new options for patients and physicians.

ACUTE
Initiated during or at the onset of a migraine attack to relieve pain and stop the progression of the attack.14,15

PREVENTIVE
Used to reduce the frequency of migraine.16

With new science comes new hope. We encourage patients and doctors to aim high when considering their treatment options.
