- New belt for the generator: Nearly \$10
- Cardboard strip for the frame: Cut to 8 cm by 30.4 cm
- Copper wire: Wind 200 feet around the cardboard frame
- Turnbuckle for adjusting belt tension costing a few extra dollars
- Steel plate used to rebuild the generator, replacing all plastic components

- **Step 2: Assembling the Components**

- Leave about 16 to 18 inches of wire on each end, removing approximately 2.54 cm of insulation from each wire end
- Glue four 1x2x5 cm ceramic magnets to the shaft, two facing the coil with their north side and two with their south side

- **Step 3: Testing and Adjustments**

- Set up an electric dummy load comprising 20 lamp sockets wired in parallel

- Test the generator with a 1.5-volt light bulb; if successful, load the generator to 8 Amps with 4 bulbs
- Fine-tune the setup, potentially increasing copper wire turns or adding another magnet for better results
- **Step 4: Ensuring Efficient Performance**
 - Initial setups revealed the ability to handle an 8 Amp load seamlessly
 - Increasing the load to 10 Amps begins to challenge the gas engine
 - Incorporating steel components resulted in a generator capable of powering eight lights with a 16 Amp load

Item	Cost
Gas Engine	\$5 (yard sale)
DC Motor	\$5 (auction)
