drax | Electric Vehicles

My Electric Vehicles

Take control of your charging network.

Our portal, My Electric Vehicles, brings you the information and controls needed to help you manage charge points, support drivers and make confident decisions as your network grows.

From a single workplace to a multi-site estate, you can see what's happening, act quickly and keep the right people informed.

Clarity today. Confidence for what comes next

See your network clearly

View live charger status, energy delivered and energy cost. If you manage more than one site, use a combined view and filter by location.

Turn data into decisions

Explore revenue, utilisation and sustainability information, then download the data for the period you need.

Keep charging moving

Check charger status and operational logs and receive email alerts for offline chargers or faults.

Manage access, pricing and the driver experience

Build a charging set-up that works for your organisation, your locations and the people who use them.

Put the right controls in place

Create access control profiles that define where and when people can charge, how they can pay and which tariff applies. Group drivers with similar needs so you can manage access consistently.

Make identification straightforward

Create and assign RFID cards to drivers or vehicles or import existing cards when you know their unique IDs.

Set pricing to suit your model

You can set tariffs, including pricing per kWh, time-based fees and connection fees. Where appropriate, you can also configure payment pre-authorisation and overstay fees.

Reward and engage drivers

Use promotions to offer time-bound charging rates with value, energy or session limits. Subscriptions can support longer-term charging offers.

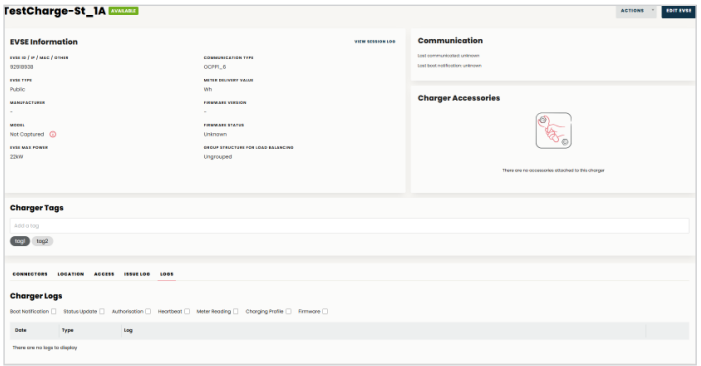

Share insight automatically

Create one-off or scheduled reports covering areas including session logs and network performance, with scheduled reports sent to relevant recipients.

Practical tools for day-to-day management

Built around the way you work

- Organisation wide or site level views
- Role based actions and permissions
- Clear reporting and alert options
- Controls that can evolve with your network
