

# Machine learning

<http://rtw.ml.cmu.edu/rtw/>

# Machine learning

- Definition
  - Getting a computer to do well on a task without explicitly programming it
  - Improving performance on a task based on experience

# Learning for episodic tasks

- First, we consider the “easier” problem of learning in episodic environments
  - The agent gets a series of unrelated problem instances and has to make some decision or inference about each of them
  - In this case, “experience” comes in the form of *training data*
- At the end of the course, we will look at learning in sequential environments (reinforcement learning)

# Example: Image classification

**input**      **desired output**

apple

pear

tomato

cow

dog

horse

# Training data

apple

pear

tomato

cow

dog

horse

# Example 2: Seismic data classification

# Example 3: Spam filter

Dear Sir.

First, I must solicit your confidence in this transaction, this is by virtue of its nature as being utterly confidential and top secret. ...

99 MILLION EMAIL ADDRESSES  
FOR ONLY \$99

Ok, I know this is blatantly OT but I'm beginning to go insane. Had an old Dell Dimension XPS sitting in the corner and decided to put it to use, I know it was working pre being stuck in the corner, but when I plugged it in, hit the power nothing happened.

# Example 4: Sentiment analysis

# The basic *supervised learning* framework

$$y = f(x)$$

output    classification    input  
          function

- **Learning:** given a *training set* of labeled examples  $\{(\mathbf{x}_1, y_1), \dots, (\mathbf{x}_N, y_N)\}$ , estimate the parameters of the prediction function  $f$
- **Inference:** apply  $f$  to a never before seen *test example*  $\mathbf{x}$  and output the predicted value  $y = f(\mathbf{x})$

# Naïve Bayes classifier

$$f(\mathbf{x}) = \arg \max_y P(y | \mathbf{x})$$

$$\propto \arg \max_y P(y) P(\mathbf{x} | y)$$

$$= \arg \max_y P(y) \prod_d P(x_d | y)$$

A single  
dimension or  
attribute of  $\mathbf{x}$

# Decision tree classifier

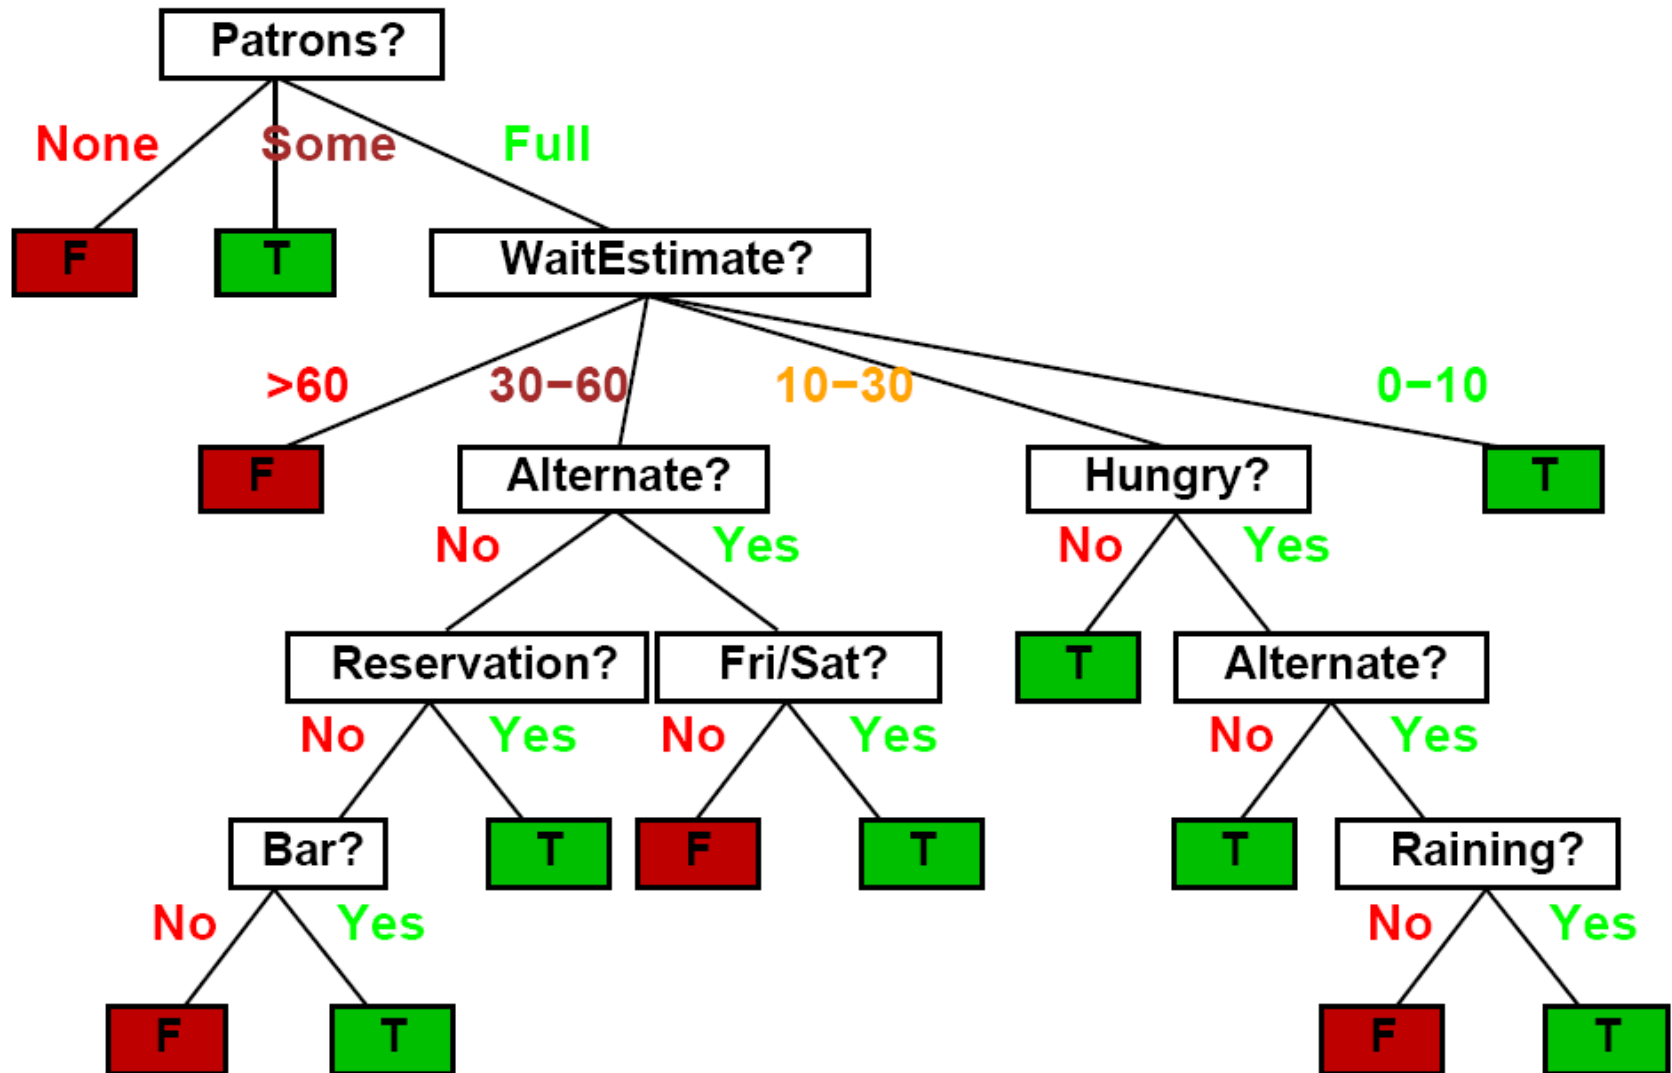

**Example problem:** decide whether to wait for a table at a restaurant, based on the following attributes:

1. **Alternate:** is there an alternative restaurant nearby?
2. **Bar:** is there a comfortable bar area to wait in?
3. **Fri/Sat:** is today Friday or Saturday?
4. **Hungry:** are we hungry?
5. **Patrons:** number of people in the restaurant (None, Some, Full)
6. **Price:** price range (\$, \$\$, \$\$\$)
7. **Raining:** is it raining outside?
8. **Reservation:** have we made a reservation?
9. **Type:** kind of restaurant (French, Italian, Thai, Burger)
10. **WaitEstimate:** estimated waiting time (0-10, 10-30, 30-60, >60)

# Decision tree classifier

Example	Attributes										Target <i>Wait</i>
	<i>Alt</i>	<i>Bar</i>	<i>Fri</i>	<i>Hun</i>	<i>Pat</i>	<i>Price</i>	<i>Rain</i>	<i>Res</i>	<i>Type</i>	<i>Est</i>	
$X_1$	T	F	F	T	Some	\$\$\$	F	T	French	0–10	T
$X_2$	T	F	F	T	Full	\$	F	F	Thai	30–60	F
$X_3$	F	T	F	F	Some	\$	F	F	Burger	0–10	T
$X_4$	T	F	T	T	Full	\$	F	F	Thai	10–30	T
$X_5$	T	F	T	F	Full	\$\$\$	F	T	French	>60	F
$X_6$	F	T	F	T	Some	\$\$	T	T	Italian	0–10	T
$X_7$	F	T	F	F	None	\$	T	F	Burger	0–10	F
$X_8$	F	F	F	T	Some	\$\$	T	T	Thai	0–10	T
$X_9$	F	T	T	F	Full	\$	T	F	Burger	>60	F
$X_{10}$	T	T	T	T	Full	\$\$\$	F	T	Italian	10–30	F
$X_{11}$	F	F	F	F	None	\$	F	F	Thai	0–10	F
$X_{12}$	T	T	T	T	Full	\$	F	F	Burger	30–60	T

# Decision tree classifier

# Nearest neighbor classifier

$f(\mathbf{x}) = \text{label of the training example nearest to } \mathbf{x}$

- All we need is a distance function for our inputs
- No training required!

# K-nearest neighbor classifier

- For a new point, find the  $k$  closest points from training data
- Vote for class label with labels of the  $k$  points

# K-nearest neighbor classifier

the data

NN classifier

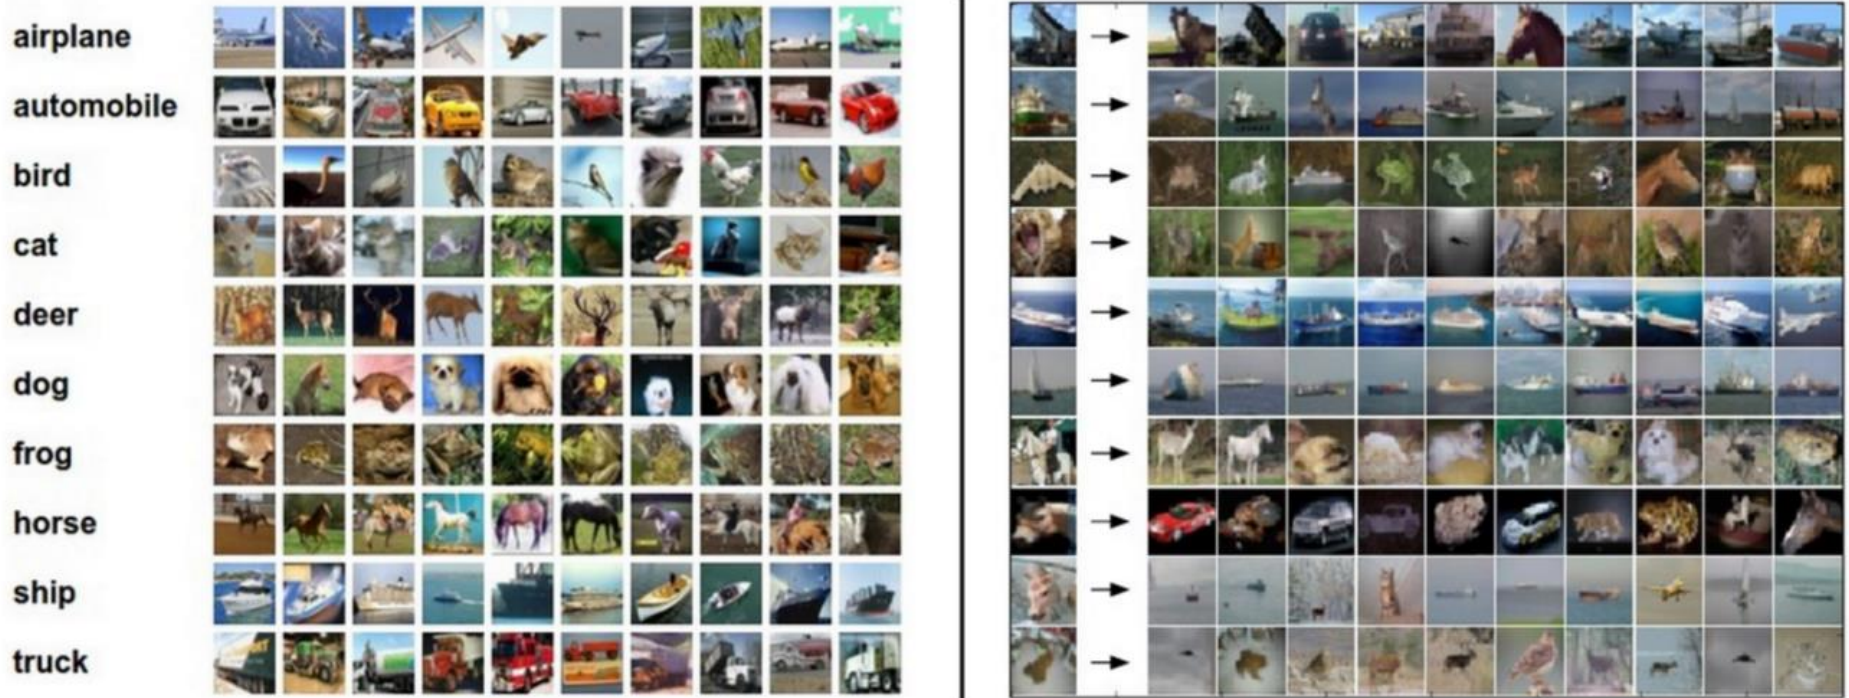

5-NN classifier

- Which classifier is more robust to *outliers*?

# K-nearest neighbor classifier

Left: Example images from the [CIFAR-10 dataset](#). Right: first column shows a few test images and next to each we show the top 10 nearest neighbors in the training set according to pixel-wise difference.

Credit: Andrej Karpathy, <http://cs231n.github.io/classification/>

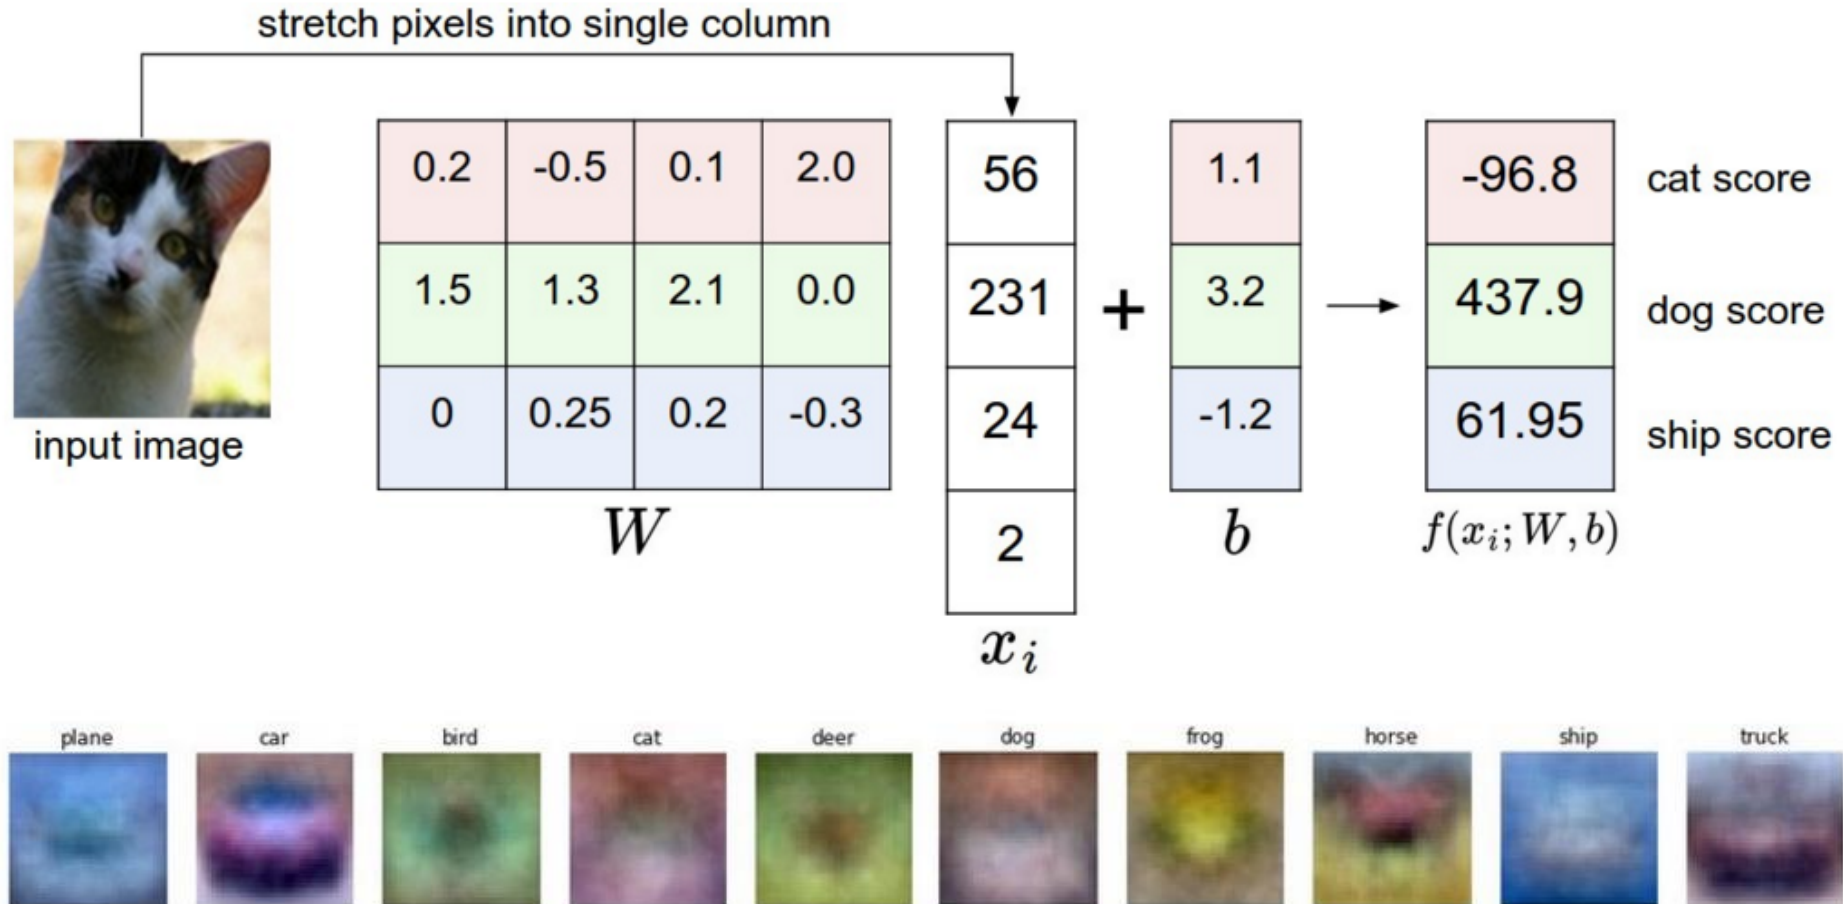

# Linear classifier

- Find a *linear function* to separate the classes

$$f(\mathbf{x}) = \text{sgn}(w_1x_1 + w_2x_2 + \dots + w_Dx_D + b) = \text{sgn}(\mathbf{w} \cdot \mathbf{x} + b)$$

# Visualizing linear classifiers

Source: Andrej Karpathy, <http://cs231n.github.io/linear-classify/>

# NN vs. linear classifiers

- NN pros:
  - + Simple to implement
  - + Decision boundaries not necessarily linear
  - + Works for any number of classes
  - + *Nonparametric* method
- NN cons:
  - Need good distance function
  - Slow at test time
- Linear pros:
  - + Low-dimensional *parametric* representation
  - + Very fast at test time
- Linear cons:
  - Works for two classes
  - How to train the linear function?
  - What if data is not linearly separable?

Learned model

# Experimentation cycle

- Learn *parameters* on the *training set*
- Tune *hyperparameters* (implementation choices) on the *held out validation set*
- Evaluate performance on the *test set*
- **Very important:** do not peek at the test set!
- *Generalization and overfitting*
  - Want classifier that does well on never before seen data
  - Overfitting: good performance on the training/validation set, poor performance on test set

# What's the big deal?

## Baidu admits cheating in international supercomputer competition

Baidu recently apologised for violating the rules of an international supercomputer test in May, when the Chinese search engine giant claimed to beat both Google and Microsoft on the ImageNet image-recognition test.

# IMAGENET Large Scale Visual Recognition Challenge (ILSVRC)

Date: June 2, 2015

Dear ILSVRC community,

This is a follow up to the announcement on [May 19, 2015](#) with some more details and the status of the test server.

During the period of November 28th, 2014 to May 13th, 2015, there were at least 30 accounts used by a team from Baidu to submit to the test server at least 200 times, far exceeding the specified limit of two submissions per week. This includes short periods of very high usage, for example with more than 40 submissions over 5 days from March 15th, 2015 to March 19th, 2015. Figure A below shows submissions from ImageNet accounts known to be associated with the team in question. Figure B shows a comparison to the activity from all other accounts.

Figure A

Figure B

The results obtained during this period are reported in a [recent arXiv paper](#). Because of the violation of the regulations of the test server, these results may not be directly comparable to results obtained and reported by other teams. To make this clear, by exploiting the ability to test many slightly different solutions on the test server it is possible to 1) select the best out of a set of very similar solutions based on test performance and achieve a small but potentially significant advantage and 2) choose methods for further research and development based directly on the test data instead of using only the training and validation data for such choices.

# Structured Prediction

Amino-acid sequence

Bond structure

# Structured Prediction

- Many image-based inference tasks can loosely be thought of as “structured prediction”

Source: D. Ramanan

# Unsupervised Learning

- Idea: Given only *unlabeled* data as input, learn some sort of structure
- The objective is often more vague or subjective than in supervised learning
- This is more of an exploratory/descriptive data analysis

# Unsupervised Learning

- **Clustering**

- Discover groups of “similar” data points

cute rabbit bunny animal

# Unsupervised Learning

- **Quantization**

- Map a continuous input to a discrete (more compact) output

# Unsupervised Learning

- **Dimensionality reduction, manifold learning**
  - Discover a lower-dimensional surface on which the data lives

# Unsupervised Learning

- **Density estimation**

- Find a function that approximates the probability density of the data (i.e., value of the function is high for “typical” points and low for “atypical” points)
- Can be used for **anomaly detection**

# Unsupervised Learning

- **Density estimation**

- Produce samples from a data distribution that mimics the training set

“Bedroom”

“Face”

Generative adversarial networks

# Continuum of supervision

**Semi-supervised**

(labels for a small portion  
of training data)

**Unsupervised**  
(no labels)

**Weakly supervised**  
(noisy labels, labels not  
exactly for the task of  
interest)

**Supervised**  
(clean, complete  
training labels  
for the task of  
interest)

# Self-supervised or predictive learning

- Use part of the data to predict other parts of the data
  - Image colorization

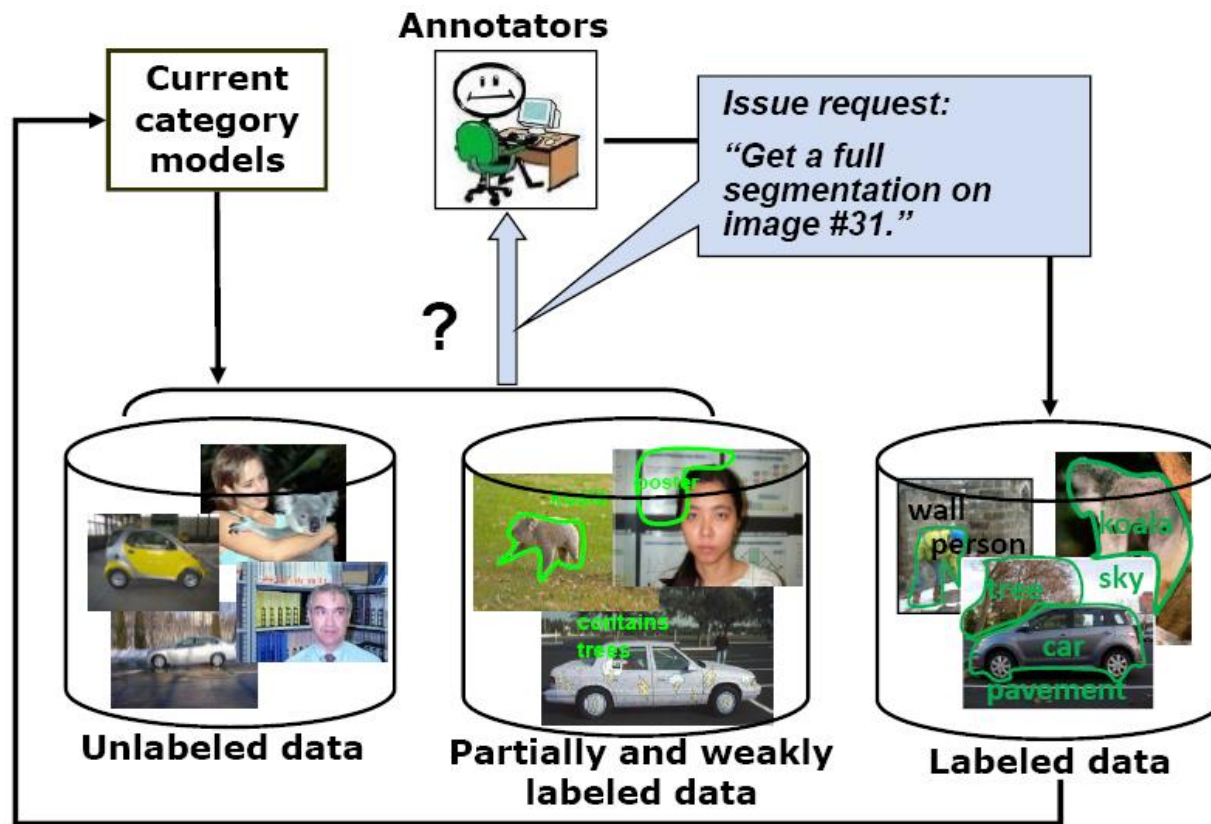

# Self-supervised or predictive learning

- Use part of the data to predict other parts of the data
  - Future prediction

# Active learning

- The learning algorithm can choose its own training examples, or ask a “teacher” for an answer on selected inputs

# Lifelong learning

## Read the Web

Research Project at Carnegie Mellon University

[Home](#)[Project Overview](#)[Resources & Data](#)[Publications](#)[People](#)

### NELL: Never-Ending Language Learning

Can computers learn to read? We think so. "Read the Web" is a research project that attempts to create a computer system that learns over time to read the web. Since January 2010, our computer system called NELL (Never-Ending Language Learner) has been running continuously, attempting to perform two tasks each day:

- First, it attempts to "read," or extract facts from text found in hundreds of millions of web pages (e.g., `playsInstrument(George_Harrison, guitar)`).
- Second, it attempts to improve its reading competence, so that tomorrow it can extract more facts from the web, more accurately.

So far, NELL has accumulated over 50 million candidate beliefs by reading the web, and it is considering these at different levels of confidence. NELL has high confidence in 2,033,557 of these beliefs — these are displayed on this website. It is not perfect, but NELL is learning. You can track NELL's progress below or [@cmunell on Twitter](#), browse and download its [knowledge base](#), read more about our [technical approach](#), or join the [discussion group](#).
