

A large commercial airplane is parked on an airport tarmac during sunset. The sky is a mix of orange, yellow, and blue. The airplane is white with a blue stripe along the fuselage. The tarmac is wet, reflecting the light. In the background, other aircraft and airport buildings are visible.

ADB SAFEGATE / Fraport

# Implementation of A-SMGCS Routing and Airport Safety Support Service on Fraport Apron

SESAR Deployment Manager  
Brussels, 25 April 2019

Andreas Eichinger (Fraport)  
Ieyasu Sugimoto (ADB SAFEGATE)

Connecting Europe Facility

# Tender Specification

Frankfurt/Main was the first airport to specify and publish a tender for an A-SMGCS fulfilling the routing and planning functionality according to Implementing Regulation (IR) 716/2014

- Requirements as written in IR 716/2014 are very vague
- Operating contexts at airports differ considerably; Frankfurt/Main is an airport with “grown infrastructure”
- General implementation guideline for industry was not available in 2016

# Project Objectives

- Compliance with IR 716/2014
- Highly integrated working environment for apron controllers with high usability on a single screen solution
- Reduced workload for controllers
- Reduced frequency usage
- Enhanced situational awareness for controllers (plus pilots and vehicles drivers)
- Operations ideally independent of weather operations
- "Optimal" routing
- Detection of (potential) conflicts
- Foundation for automated guidance

**Co-financed by the European Union**

Connecting Europe Facility

• • • • • • •

# Product Goals

- **Intuitivity** – simple and intuitive user interaction
- **Configurability** – highly configurable with parameters
- **Modularity** – system is based on different services based on modules
- **Interoperability** – interfaces are future proof, less use of proprietary interfaces
- **Automation** – high, but configurable level of automation; controller as supervisor
- **Focus** – only relevant information is displayed, additional information can be easily retrieved
- **Expandability** – services and other components have to be expandable
- **Flexibility in role concept** – system has to support current and future controller roles and responsibilities

# How did we proceed?

2016-2017                      Bid process, evaluation phase (five days per bidder)

2017                              Tender award

2017 onwards                Realisation (industrialisation) in two phases

**Phase 1:** Focus on IR 716/2014 compliance

Mid 2019:                      Start apron simulator integration

End of 2019:                Start training

End of 2020:                Go-live

**Phase 2:** Enhancements beyond IR 716/2014 (e.g. guidance functionality)

**Co-financed by the European Union**

Connecting Europe Facility

• • • • • • •

# Lessons learned so far...

- Even though **SESAR validation** for routing and planning functionalities was successfully executed, none of the products tested during the evaluation phase was mature enough to be deployable out of the box at Frankfurt/Main. All products required further development (**industrialisation**).
- SESAR focuses rather on **technical solutions** rather than **operational challenges** and **user interfaces** or **user experience**.
- Basic routing and planning functionality was available, but support for operations at **airports with complex infrastructure/layouts** and **high-density operations** was not mature.

# Scrum Methodology

# Change Management

The implementation of the jointly developed Apron Controller Working Position (ACWP) at Frankfurt/Main will **significantly change the working environment and the actual work of apron controllers**. Proper change management is paramount to ensure a **smooth transition**! What does this mean in practice?

- Apron controllers are involved in development and implementation processes
- We have two demo systems showing the current state of the system at two apron control towers.
- Apron controllers are part of the project team reviewing sprint results and planning upcoming sprints.

# ADB SAFEGATE / Fraport Product Functionality for Routing and Planning and Surface Safety Nets

# Surveillance Service

Routing and Safety Support Service demand a higher surveillance performance, also in areas that are close to terminal buildings

- Otherwise nuisance alerts irritate controllers
  - Route deviation alerts caused by wrong detection
  - Wrong safety net alerts (e.g. Push without Clearance)
- More interaction with the target label => needs to be steady

# Electronic Clearance Input

Fundamental for support of Safety Support Service and Routing Service

Tight Integration with Routing Service

- Routing Service calculates the handover points
- Workflow Service calculates clearance input based on handover points

Either input via target label or via electronic flight strips

# Electronic Clearance Input

## Example Workflow – Routing Integration

# Electronic Clearance Input

# Electronic Clearance Input

# Electronic Clearance Input

Clearance in label instead of flight plan supports stripless working

Synchronized with electronic flight strip supports both ways

Co-financed by the European Union  
Connecting Europe Facility

# Route Proposal and Modification

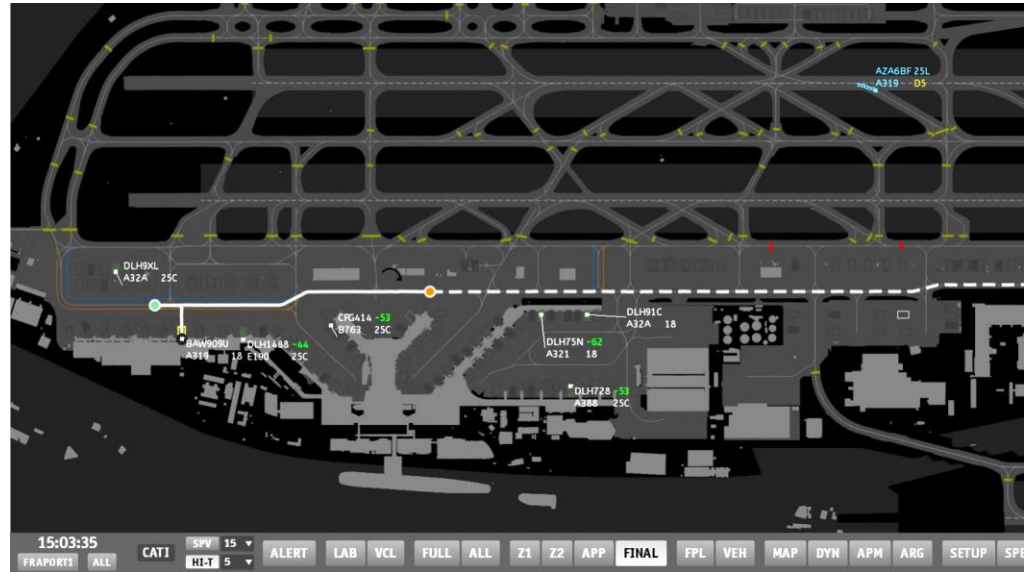

- Aircraft (CCA935) is assigned a route based on configuration parameter
  - Standard route patterns depending on
    - Position and Destination,
    - Runway Configuration,
    - Visibility,
    - Aircraft Class and Type.
    - Taxiway availability (closures)
- Controller can change the route proposal
- Route is cleared (grey => green)

# Area of responsibility

- Route proposal (BAW909U) automatically includes handover point (red dot)
- Clearance automatically only up to handover point
- Route modifications only in own AoR

# Handover of Responsibility

- When aircraft reaches handover point, controller transfers.
- Next controller will clear next segment with "CONTINUE"
- Route indication shows clearance

# Routing Clearance Limit

- Controller can add clearance limit
- Different representation (solid => dashed)
- Continue action to clear rest of route

# Pushback as Part of Routing Service

- Default standard PB Procedure depends on position, aircraft type or wing span category, runway configuration, visibility (Area 2, taxi via N7)
- Other standard PB procedures can be displayed and selected
- Proposed route will change accordingly (Area 7, taxi via N8)

# Free Pushback as Part of Routing Service

- Free Pushback can be entered
- Change from Area 7 to non-standard point on N8, nose facing west
- Route is adapted accordingly

# Tow Routing as Part of Routing Service

- Same routing functionality as for aircraft also applies for tows
- PB procedure can be selected
- Different standard route configuration compared to aircraft
- Note: Vehicles not part of routing service

# Stand Status as part of Planning Service

Indicate the status of the stand visualized on the a Airport map

- Show state of positions (free, occupied, etc.)
- Show next flights/tows at gate
- Safety logic to avoid A/C conflicts
- Display A-CDM Information

# Airport Safety Support Service - CMAC

## Taxi without Clearance

- Movement detected
- No ECI

# Airport Safety Support Service – CATC

## Conflicting ATC Clearance

- ECI Input
- Conflict detected

## Case shown

- Controller gives Take-Off Clearance
- ASSS detects that a vehicle is on the runway
- Warning is displayed

Note: not part of delivery in Fraport project

Co-financed by the European Union

Connecting Europe Facility

• • • • • • •

# Usability and User Acceptance

A-SMGCS used to be a support screen

- User interaction with the system used to be limited
- Users log on to screen, set their window preferences, and will interact rarely

A-SMGCS becomes an operational tool

- Much more interaction on A-SMGCS (Electronic Clearance Input, Route modifications)

Integrated Controller Working Position in general

- More information is shown on screen => abstraction needed to avoid overflow
- More user interaction with elements shown on screen => more focus on UI/UX

# ADB SAFEGATE / Fraport Interim Results

**ADB  
SAFEGATE**

**Fraport**

# Interim Results/1

- As software development is based on SCRUM we have a **pretty good idea on the state of the system** and, thus, the project. In addition to this, we have regular releases (“potentially shippable increments”) on two demo systems in our apron control towers to allow for continuous and fast feedback.
- The **inauguration of the new system** was initially planned for 30 June 2019. We will incur significant delay.
- Clearly a **huge gap between validation and industrialisation of technology** exists.

# Interim Results/2

- Frankfurt/Main employed a **multi-stage supplier selection process following EU rules**. As we wanted to be sure to select the best supplier we included 5 day test installations in Frankfurt/Main in the selection process and weighed functional capabilities and price roughly equal.
- The **design of the supplier selection process** made sure that the most suitable supplier for our operating context was selected.
