THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

Introduction

The Netherlands

These installation instructions have been made in such a way as to comply with the applicable Dutch norms for installation of heating cables.

The installation must be in conformity with the installation regulations NEN-1010, the requirements as per the guidelines of 1985 of the "Direktoraat Generaal van de Arbeid" for hazardous areas and the regulations as per the norm EN-NEN 50.014 - 50.020 for hazardous areas (where applicable).

Applying these installation instructions will ensure compliance with the requirements of the "Arbeidsinspectie" and the general guidelines as made out by the local electricity board.

Note:

- In all cases heat tracing systems must be protected by means of earth fault protection of 30 or 300 mA.
- In all cases the braid of the heat tracing cable must be connected to a suitable earthing system.
- Materials with **IND** in the product reference are for use in non-hazardous areas only.
- Materials with **Ex** in the product reference are for use in hazardous areas.

Belgium

These installation instructions have been made to ensure compliance with the applicable Belgian norms for installation of heating cables.

The installation must be in conformity with the installation regulations AREI / RGIE and the regulations as per the norm NBN C-23-001, C-23-101 thru 106 for hazardous areas (where applicable).

Applying these installation instructions will ensure compliance with the requirements of the "Arbeidsinspectie" and the general guidelines as made out by the local electricity board.

THERMON...The Heat Tracing Specialists®

Upon receipt of Thermon heat tracing materials

Check the supplied materials and quantities against the packing lists. In case of deviations please contact Thermon within 3 days.

A) Inspection of the TESH/TES heating cable

1. Check the printing on the heating cable to make sure that the correct type and resistance have been received. (see page 6 and 8)
2. Check the printing on the cold lead cable to make sure that the cable with the correct conductor size has been received (see page 7 and 9 for cold lead data).
3. Inspect visually for any damage incurred during shipment.
4. Store in a dry place.

Caution:

Do not connect power to the heating cable while it is on the reel or in the shipping carton.

B) Inspection of accessories for heat tracing cable (if applicable)

Cable accessories

- Insulation Entry Kits (IEK-TES)
- Power and End Termination Kits (PETK....-TES-OJ-...)
- cable glands (M20-PT100/TES-EXE...)
- pipe support/cable entry device XP Plus for junction boxes/thermostats/limiters (mention cable type when ordering)
XP Plus grommet:
GR-3E for all TESH and TES
- heat shrink sets for TESH CL- 2.5 mm² cold lead cable CETI 1525 (IND)
- connector sets for all TESH CL-... cold lead cables TESHFIT-EX (Ex)

General accessories

- circuit switches
- thermostats (TED-.../T-.../TC-...)
- junction boxes (JB-K-CW-...)
- pipe support (XP-1...) for junction boxes/thermostats/limiters
- RTV silicon sealant
- Fixing Tape (FT-1L/FT-1M/FT-1H)
- aluminium tape (AL-20P/AL-30P)
- SS clamps (ABA)/B-type banding (B-4/B-10/B-21)
- punch strip
- Caution Labels (CL . .)

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

PAGE 3

Installation sequence of heat tracing system

1. Ensure that all piping and equipment to be traced is completely installed, tested and released.
2. Equipment surface should be reasonably clean. Any loose scale, oil or rust should be removed. Sharp edges should be avoided to prevent the cable from being damaged during installation.
3. Coating on pipes must be dry before the heating cable is installed.
4. Install the correct heating cable lengths indicated in the design. **Any deviation from these lengths will result in a change in output!**
5. Determine which heating circuits can be made from which reel.
6. Start, if possible, to install the long heating circuits first.
7. Take the correct reel for the line to be traced.
8. If the required length of heating cable has been determined, the connection between the cold lead cable to the heating cable can already be made in the workshop.
9. In order to connect the TESH/TES cable, two options are available for each area of application (Ex or IND):

In Explosion Proof Area (Ex)

- a) Direct connection of max. 3 times 175 mm TESH/ TES heating cable in Thermon JB-K/XP Plus... or JB-K-0... junction boxes. Either via a gland (page 23) or an expediter XP Plus (page 20). For termination of the cable see page 19.

Following criteria are applicable to this practice:

| T-Class | Maintenance temperature | Max. allowed heating cable output |
|---------|-------------------------|-----------------------------------|
| T5 | up to +100°C | up to 8 W/m |
| T4 | up to +100°C | up to 11 W/m |
| | +101°C up to 125°C | up to 10 W/m |
| | +126°C up to 135°C | up to 8 W/m |
| T3 | up to +75°C | up to 16 W/m |
| | +76°C up to 100°C | up to 12 W/m |
| | +101°C up to 125°C | up to 10 W/m |
| | +126°C up to 150°C | up to 8 W/m |
| | +151°C up to 200°C | up to 5 W/m |

- b) With higher cable outputs than mentioned under point a) direct connection of TESH/TES heating cable in junction box is not allowed. A TESH CL-... cold lead cable utilising the TESHFIT-EX EEx e certified connector shall be applied to the heating cable. The cold lead cable can be connected in the junction box. For installation of the connector see page 15.

Non Explosion Proof Area (IND)

- a) Direct connection of max. 3 times 175 mm TESH/ TES heating cable in Thermon JB-K/XP Plus... or JB-K-0... junction boxes. Either via a gland (page 23) or an expediter XP Plus (page 20). For termination of the cable see page 19.

Following criteria are applicable to this practice:

| Maintenance temperature | Max. allowed heating cable output |
|-------------------------|-----------------------------------|
| up to +75°C | up to 16 W/m |
| +76°C up to 100°C | up to 12 W/m |
| +101°C up to 125°C * | up to 10 W/m |
| +126°C up to 150°C * | up to 8 W/m |
| +151°C up to 200°C * | up to 5 W/m |

* for XP Plus-IND max. pipe temperature 120°C

- b) With higher cable outputs than mentioned under point a) direct connection of TESH/ TES heating cable in junction box is not allowed.

Either a TESH CL-2.5 cold lead cable utilising the CETI 1525 or any TESH CL-... cold lead cable utilising the TESHFIT-EX connector shall be applied to the heating cable. The cold lead cable can be connected in the junction box. For installation of the CETI 1525 see page 11, For installation of the TESHFIT-EX see page 15.

10. The junction box with non-metallic expediter XP Plus can be mounted to the heating cable in the workshop (see power termination page 19), with or without non-metallic expediter XP Plus, page 20 - 22). See table 5.1 for further information.

| Colour XP Plus | Application | |
|----------------|-----------------------|---------------|
| | Max. pipe temperature | Area |
| Brown/black | 200°C | Hazardous |
| Grey | 120°C | Non-hazardous |

Table 5.1 application area XP Plus

11. In case a thermostat/limiter EEx d must be mounted to the pipe, this must be done first (see page 25 - 32). Mark by means of for example a permanent marker the controller knob with C and the limiter knob with L, for EEx ed or IND thermostat with XP Plus see page 25 - 29. For horizontal pipes it is recommended to mount the thermostat in an up right position.

In case a thermostat with XP Plus is mounted at the bottom section of a pipe, moisture can accumulate on the grommet inside the XP Plus. To prevent this, one of the knock-out holes must be opened, for draining purposes. Ensure that the thermostat is not mounted too close to an instrument or flange, since the thickness of the thermal insulation at those locations can be such that the thermostat is partly or totally covered by the insulation.

THERMON...The Heat Tracing Specialists®

Installation sequence of heat tracing system

12. Determine the position of the junction box and from that point lay out the cable over the pipe. Mount the junction box on the pipe (See page 20 - 23). For horizontal pipes it is recommended to mount the junction box in an upright position. If a junction box with an expediter XP Plus is mounted at the bottom section of a pipe, moisture can accumulate on the grommet inside the XP Plus. To prevent this, one of the knock out holes must be opened, for draining purposes. Ensure that the junction box is not mounted too close to an instrument or flange, since the thickness of the thermal insulation at those locations can be such that the junction box is partly or totally covered by the insulation.

With a "single phase + neutral" or a "two phase" system, the cable will start from , and end at one point. With a "three phase" system three cables should be laid out over the pipe and at the end be connected in star into a termination box.

Mount the heating cable to the pipe by means of fixing tape (FT-1L/FT-1M/FT-1H).

Caution:

FT-1L tape for pipe temp. up to 85°C

FT-1M tape for pipe temp. up to 200°C

FT-1H tape for pipe temp. up to 260°C

Ensure that the heating cable is mounted on the pipe at the right location (see page 36). The heating cable is to be fixed to the pipe every 30 cm by means of fixing tape. If required, the heating cable, after having been fixed to the pipe, must be covered with aluminium tape. In case of plastic pipes with a low temperature resistance, the pipe must be wrapped with aluminium foil before the heating cable is mounted.

13. Ensure the correct amount of cable is allowed for locations where additional heat losses can be expected (such as pipe supports, flanges, valves, instruments etc., see page 37 and further). **The heating cables may never touch or cross one another.**
14. In case the heating cable cannot be terminated in the junction box at once, the cable ends must be sealed off temporarily with some RTV-2 silicon sealant.
15. If applicable, connect a cold lead cable to each end of the heating cable.
16. Protect the cable against damage at those locations where damage could typically occur (at insulation endplates at valves, pumps etc.)
17. Checking of the heat tracing circuit.

Installed heat tracing systems will only perform as expected if installed according to the design documents. In order to ensure this a suggested heat tracing checklist is shown on page 46 of this manual. The suggested heat tracing system checklist is divided into 4 parts.

Part 1. General project and circuit information for references: Thermon suggests to use this part as a guide in order to have your heat tracing circuit references available.

Part 2. Checks to be done after installation (before thermal insulation is installed)

Thermon suggests this part as a guide to make sure installation is checked prior to insulation. This avoids unnecessary costs for removing insulation in case something went wrong during installation.

Meggering prior to thermal insulation and installation of cladding:

- to ensure electrical insulation integrity
- test voltage 1000 Vdc
- test result 20 MOhms
- results need to be recorded in checklist

Part 3. Checks to be done after thermal insulation and cladding

Thermon suggests this part as a guide to make sure that:

- the right insulation has been installed (as specified in the heat tracing design) and cladding entries of heat tracing system are weatherproof
 - the heating tracing system has not been damaged while installing the thermal insulation and its cladding, which can have sharp edges
 - temperature controller setting
- These checks ensure that the heat tracing system will perform as expected.

Meggering after thermal insulation and installation of cladding:

- to ensure electrical insulation integrity, and heating cables are not damaged in by thermal insulation covered areas
- test voltage 1000 Vdc
- test result 10 MOhms
- results need to be recorded in checklist

Part 4. Final test

Thermon suggests this part as a guide to check whether the heat tracing system installation complies with the heat tracing system design.

Caution:

Information marked with ** is important in case stabilised design has been applied for the particular heat tracing circuit and must be recorded. All those parameters need to be thoroughly checked with design documents to ensure safety and functionality of stabilised design.

Design documents:

- Heat tracing isometrics
- Heat tracing circuit lists, bill of materials

In case of stabilised design (Thermon advises to apply the below in any case):

- design documents to be issued by Thermon Engineering or Thermon CompuTrace software
- the end user must record the system parameters with the **-mark and the applicable T-class on the checklist
- the end user needs to keep a record of the applicable design documents and checklists

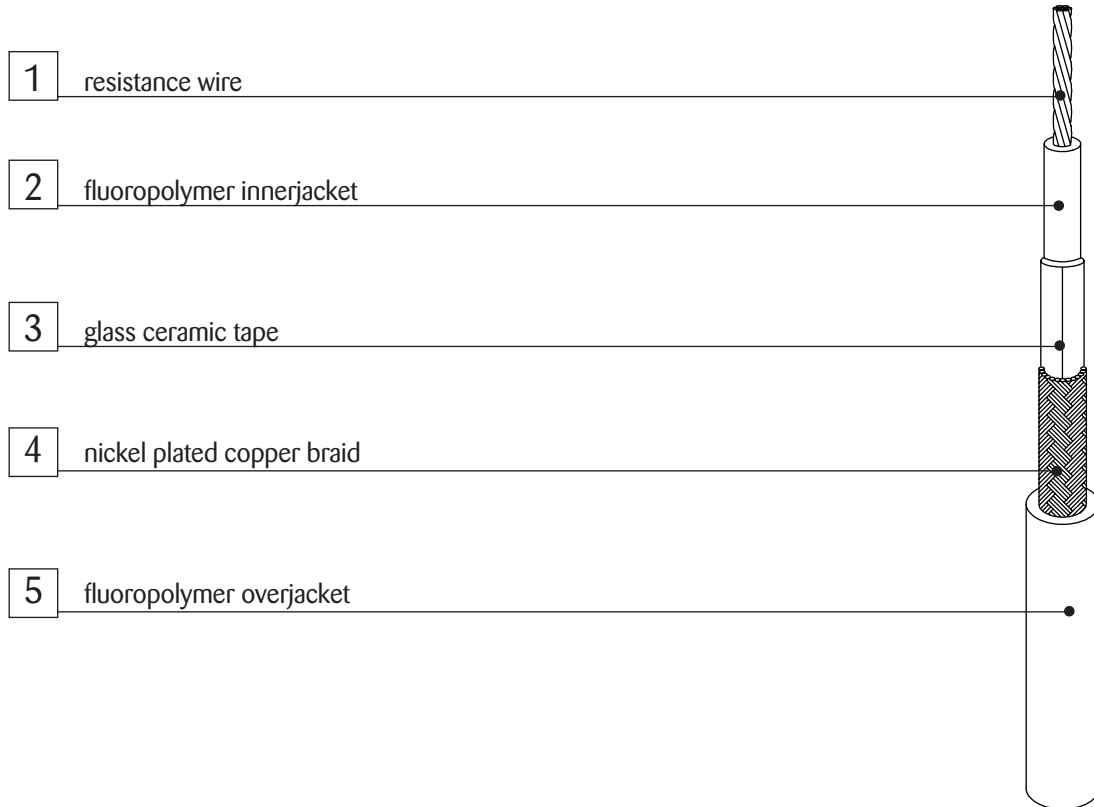

18. Make sure caution labels (see page 35) are installed visible on the insulation cladding every 3m.

THERMON...The Heat Tracing Specialists®

Typical heat tracing system

THERMON...The Heat Tracing Specialists®

Heat shrink connection CETI (IND) for installation of cold lead cable 2.5 mm²

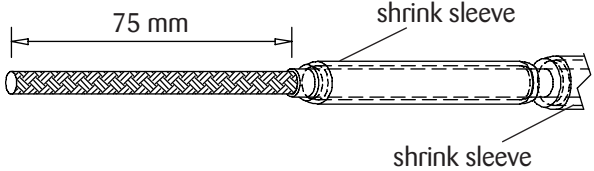

Heat shrink set CETI 1525 for 2 connections

| | | |
|---|--|--|
| a | 2 pcs PTFE shrinksleeves SM-TES-9 (L=170mm) |  |
| b | 4 pcs PTFE shrinksleeves SM-TES-4 (L=40mm) |  |
| c | 2 pcs PTFE shrinksleeves SM-TES-1.5 (L=40mm) |  |
| d | 2 pcs crimp connectors 2.5 mm ² |  |
| e | 2 pcs crimp connectors 1.5 mm ² |  |
| <p>Special tools to be provided by installation contractor:</p> <ul style="list-style-type: none"> - hot air gun of approx. 1400 W - ratched controlled crimping plier for uninsulated crimp connectors. <p>For connection of two TES cables see step 5 (page 12)</p> | | |

Procedure

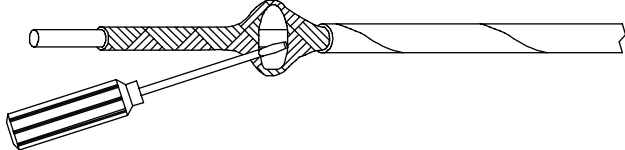

1 Termination of the TESH CL-2.5 cold lead cable

Slip shrink sleeve SM-TES-9 over the TESH CL- 2.5 mm² cold lead cable first, and then the shrink sleeve SM-TES-4. Remove the overjacket over 75 mm.

2 Push back the braid so that the openings in the braid get wider.

Pull the insulated conductor and glassceramic tape through the braid near the overjacket. Cut and remove the glassceramic tape at the overjacket. Twist the braid.

THERMON...The Heat Tracing Specialists®

Heat shrink connection CETI (IND) for installation of cold lead cable 2.5 mm²

- 3 Cut back the conductor by 20 mm.
Remove the innerjacket over 12 mm.

- 4 Slip the crimp connector of 2.5 mm² over the conductor and the crimp connector of 1.5 mm² over the twisted braid.
Crimp both crimp connectors twice.

Caution:

Use a ratched controlled crimping plier for uninsulated crimp connectors of 1.5 mm² and 2.5 mm².

- 5 Termination of TESH/TES heating cable

Note:

For connecting two TESH/TES cables this procedure must be done for each cable end.

Remove the overjacket over 70 mm.
Slip the shrink sleeve SM-TES-4 over the heating cable.

- 6 Push back the braid so that the openings in the braid get wider.

For TESH:

Pull the insulated conductor and glassceramic tape through the braid near the overjacket. Cut and remove the glassceramic tape at the overjacket.
Twist the braid.

For TES:

Pull the insulated conductor through the braid near the overjacket. Twist the braid.

THERMON...The Heat Tracing Specialists®

Heat shrink connection CETI (IND) for installation of cold lead cable 2.5 mm²

- 7 Remove the innerjacket over 24 mm.
Cut back the conductor and the twisted braid by 12 mm. Keep the pieces of conductor and braid for later use.

- 8 First slip the shrink sleeve SM-TES-1.5 over the crimp connector that has been mounted to the cold lead cable, as shown.
Put the conductor of the heating cable into the 2.5 mm² crimp connector, together with the little piece of **braid** (see step 7), to fill up the connector sufficiently.
The little piece of **conductor** is only used to fill up the crimp connector in case TESH/TES-11.7, 15, 31.5, 80 and 100 cable is connected. The TESH/TES-10 cable can be mounted directly into the 2.5 mm² crimp connector.
Crimp the crimp connector twice.
Cut back the twisted braid in such a way that the crimp connectors are staggered (as shown).

- 9 Slip the shrink sleeve SM-TES-1.5 over the crimp connector as shown.
Put the twisted braid into the butt connector. See to it that no loose braiding wires stick out near the overjacket and from under the crimp connector.
Crimp the crimp connector twice.

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

PAGE 13

Heat shrink connection CETI (IND) for installation of cold lead cable 2.5 mm²

- 10** Position both shrink sleeves SM-TES-4 as shown. Heat shrink the sleeves by means of a hot air gun (or gas torch).

- 11** Slip back the previously positioned shrink sleeve SM-TES-9 (see step 1) over the connection and heat shrink the sleeve.
In order to connect the other end of the heating cable with the cold lead cable, the same procedure must be followed, starting with step 1 at page 11.

Thermon provides complete Power and End Termination Kits for the overjacketed TESH/TES heating cable. If these kits are used all needed materials are included in the kit.

There are kits available to be used in combination with XP Plus (PETK/XP Plus-...-TES-OJ-...) and kits to be used as side entry into the thermon junction box JB-K-0 M20/M25...(PETK-...-TES-OJ-...).

See type description PETK sets.

Installation of EEx e cold lead connectors TESHFIT-EX

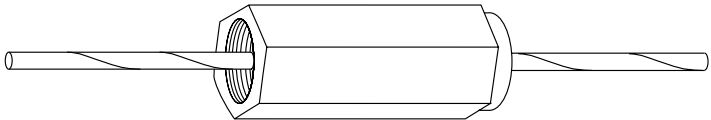

The Ex connectors between the TESH/TES heating cable and the TESH CL-... cold lead cable or between two TESH/TES cables can be installed without using a heat source.

TESFIT-EX for two connections:

| | | |
|----------|---|---|
| a | 1 pc stainless steel enclosure |  |
| b | 1 pc stainless steel cap |  |
| c | 2 pcs insulating shells |  |
| d | 6 pcs fluoropolymer conical sealing discs |  |
| e | 2 pcs stainless steel washers |  |
| f | 1 pc fluoropolymer terminal block |  |
| g | termination instructions |  |

Tools to be provided by installation contractor:
- Wrench no. 27 (mm)

Procedure

| | | |
|----------|--|--|
| 1 | Push the stainless steel enclosure (a) over the TESH CL-... cold lead or TESH/TES heating cable with the threaded side towards the end of the cable. |  |
|----------|--|--|

3 Push the fluoropolymer shell (c) over the cable, with the open side towards the end of the cable.

Push the conical sealing disc and the fluoropolymer terminal shell in the stainless steel enclosure.

THERMON...The Heat Tracing Specialists®

Installation of EEx e cold lead connectors TESFIT-EX

- 4 Push the stainless steel cap (b) over the TESH CL-... cold lead or TESH/TES heating cable with the threaded side towards the end of the cable.

- 5 Push the fluoropolymer conical sealing disc (d) and if necessary the metallic washer (e) over the cable.

Caution:
TESH CL-... cold lead cables and TESH/TES heating cables have a variety of cable diameters.

Consult the table of step 2 to select the applicable conical sealing disc for cable to be terminated.

- 6 Push the fluoropolymer insulating shell (c) over the cable, with the open side towards the end of the cable.

Push the conical sealing disc and the fluoropolymer terminal shell in the short body stainless steel enclosure.

- 7 **Termination of TESH CL-... cold lead or TESH/TES heating cable**

Remove overjacket over 35 mm.

- 8 Push back the braid so that the openings in the braid get wider. Twist the braid.

For TESH:
Pull the insulated conductor and glassceramic tape through the braid near the overjacket. Cut and remove the glassceramic tape at the overjacket. Twist the braid.

For TES:
Pull the insulated conductor through the braid near

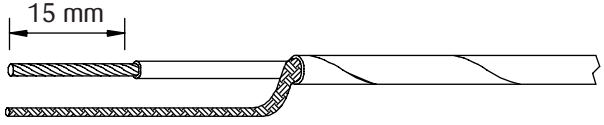

THERMON...The Heat Tracing Specialists®

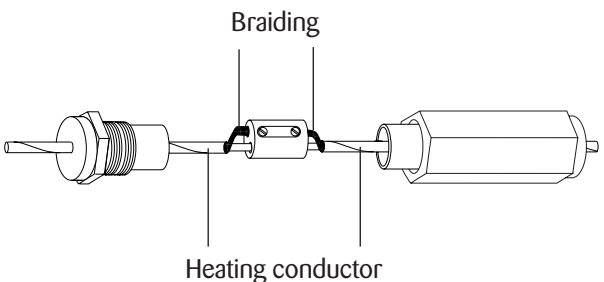

INSTALLATION INSTRUCTIONS TESH/TES

Installation of EEx e cold lead connectors TESFIT-EX

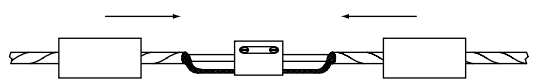

9 Remove innerjacket over 15 mm.
Caution:
 Do not cut strands of the heating conductor.
 For terminating the second TESH CL-... cold lead or TESH/TES heating cable repeat steps 7 through 9.

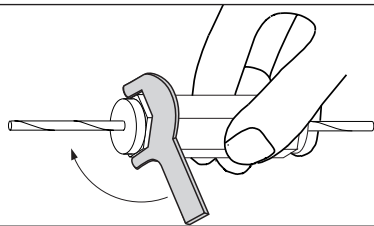

10 Install the two heating conductors in the same terminal of the fluoropolymer terminal block, the conductors need to overlap each other totally. Tighten the two screws of the applicable terminal. Guide the two ends of twisted braid into the remaining pair of holes of the fluoropolymer terminal block. Tighten the two screws of the applicable terminal.
Caution:
 Don't overlap the braiding and check that no small pieces of braid are stick out.

11 Guide stainless steel enclosures including the fluoropolymer terminal shells over the fluoropolymer terminal block.

12 Screw the stainless steel cap into the stainless steel enclosure till the hexagonals are tight together. Use a wrench no. 27 (mm).
 In order to connect the other end of heating cable with the cold lead cable, the same procedure must be followed, starting with step 1 at page 15.

Thermon provides complete Power and End Termination Kits for the overjacketed TESH/TES heating cable. If these kits are used all needed materials are included in the kit.

There are kits available to be used in combination with XP Plus (PETK/XP Plus-...-TES-OJ-...) and kits to be used as side entry into the thermon junction box JB-K-0 M20/M25...(PETK-...-TES-OJ-...).

See type description PETK sets.

THERMON...The Heat Tracing Specialists®

Termination of TESH CL-... cold lead cable and TESH/TES heating cable

- 1 Remove the overjacket over 150 mm.

- 2 Push back the braid so that the openings in the braid get wider.

For TESH CL-... and TESH:

Pull the insulated conductor and glass ceramic tape through the braid near the overjacket. Cut and remove the glass ceramic tape at the overjacket. Twist the braid.

For TES:

Pull the insulated conductor through the braid near the overjacket. Twist the braid.

- 3 Remove the innerjacket over 10 mm.

- 4 Slip a piece of yellow/green sleeve over the twisted braid and mount correct wire pins.

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

Installation of junction box JB-K with expediter XP Plus

1 Construction XP Plus.

Caution:

- Black/brown XP Plus is for application in hazardous areas (EEx e) and for max. pipe temp. up to 200°C
- Grey XP Plus is for application in Non-hazardous (IND) area and for max. pipe temp. up to 120°C.

- ## 2
- Verify if the right grommet is selected (see below). Put each heating cable through one of the slots in the XP Plus. Cut in the membrane in the grommet for each heating cable. Use the small holes for cables up to 6 mm and the large holes for cable diameters of 7-10 mm. Slide the grommet over the heating cable down to the collar at the inside of the XP Plus as shown.

Caution:

XP Plus grommet to be checked:

- grommet GR-3E for TESH/TES
- grommet GR-3G for HPT (see HPT installation instruction)

- ## 3
- Caution:**
The heating cable must protrude 175 mm above the XP Plus!!!

- ## 4
- For termination of the heating/cold lead cable see page 19.

THERMON...The Heat Tracing Specialists®

Installation of junction box JB-K with expediter XP Plus

5 Remove the locknut from the compression nipple. Slide the nipple over the cable and screw it manually into the XP Plus housing.

Option a (recommended):

Put the XP Plus-LN-Tool (to be ordered separately) on its side into the slots as shown alongside, and screw the nipple carefully down to the grommet.

Option b:

Put a screwdriver into the slots as shown alongside, and screw the nipple carefully down to the grommet.

6 Place the junction box on the XP Plus. Tighten the locknut with the XP Plus-LN-Tool (to be ordered separately). Connect the heating cable to the terminals. Mount the cover on the junction box

Caution:

Tighten screws cross wise.
Close entries with blindplug and/or gland.
Mount the junction box with XP Plus on the pipe.

7 The XP Plus is mounted to the pipe with the following mounting materials:

- ABA 25 Clamp: 1/2" diam. pipe
- ABA 40 Clamp: 3/4" diam. pipe
- B-4 banding: > 1" ≤ 4" diam. pipe
- B-10 banding: > 4" ≤ 10" diam. pipe
- B-21 banding: > 10" ≤ 21" diam. pipe

THERMON...The Heat Tracing Specialists®

Installation of junction box JB-K with expediter XP Plus

- 8 Place the non-metallic expediter XP Plus on the pipe and insert the ABA clamp or B-type banding (B-4...B-21) through the slots of the XP Plus. Tighten the ABA clamp or B-type banding with a screwdriver.

Caution:

In case the XP Plus is mounted at the bottom section of a horizontal pipe, the knock-out hole at the lowest position must be opened. See also sketch along side.

THERMON...The Heat Tracing Specialists®

Installation of junction box JB-K-0 with mounting bracket XP-1

- 1 Cable gland type M20-PT100/TES-Exe is to be slid over the cable as shown.

Caution:

In case an insulation entry kit type IEK-TES is used, this must be put over the heating cable prior to the cable gland.
For termination of the heating cable see page 23.

- 2 Put the heating cable into the junction box and install the gland. Position the heating cable and tighten the cap of the cable gland. Connect the cable to the terminals. Mount the junction box to the mounting bracket with SS bolts, nuts and rings. (to be supplied by electrical contractor). Mount the cover on the junction box.

Caution:

Tighten the screws cross wise.
Close the entries with blindplug and/or gland. After this the combination JB-K/XP-1 can be mounted onto the pipe.

THERMON...The Heat Tracing Specialists®

Art. no.: 461.000.032
(other types and languages available on request)

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

Installation on pipe work

In principle the heating cable is mounted parallel to the pipe and fixed by means of fixing tape as shown on the sketch alongside. Only if prescribed in the design, the cable must be covered with aluminium tape.

Description:

FT-1L tape for max. 85°C
 FT-1M tape for max. 200°C
 FT-1H tape for max. 260°C

Art. no.:

460.550.817
 460.551.920
 460.552.660

For applications with multiple passes of heating cables, we refer to the sketch alongside.

Note:

One limiter per heating cable connection in Ex area.
 With a three phase system each heating cable must be supplied with a limiter, or in Ex area, with a combination of one limiter and a three phase current protection relay.

THERMON...The Heat Tracing Specialists®

Installation on valves

| TYPICAL CABLE ALLOWANCES PER VALVE * (single pass) in mm | | | | | |
|--|--------------------------------------|--------|---------------------------------|---------------------------------|---|
| N O M I N A L | P I P E S I Z E | D N | S C R E W E D | F L A N G E D | B U T T E R F L Y |
| | | | | | |
| NPS | | | | | |
| | 1/2" | 12 | 150 | 300 | -- |
| | 3/4" | 20 | 220 | 450 | -- |
| | 1" | 25 | 300 | 600 | 300 |
| | 1 1/2" | 40 | 450 | 600 | 450 |
| | 2" | 50 | 600 | 750 | 600 |
| | 2 1/2" | 65 | | 900 | 750 |
| | 3" | 80 | | 1050 | 750 |
| | 4" | 100 | | 1500 | 900 |
| | 6" | 150 | | 2400 | 1050 |
| | 8" | 200 | | 3300 | 1200 |
| | 10" | 250 | | 4200 | 1350 |
| | 12" | 300 | | 5000 | 1500 |
| | 14" | 350 | | 5900 | 1650 |
| | 16" | 400 | | 6900 | 1800 |
| | 18" | 450 | | 8100 | 1950 |
| | 20" | 500 | | 9000 | 2100 |

The heating cables should not touch or cross one another. When prescribed in design apply aluminium tape over the heating cable.
Min. bending radius of the heating cable is 5 x cable diameter.

THERMON...The Heat Tracing Specialists®

Installation on pumps

| TYPICAL CABLE ALLOWANCES PER PUMP (per pass) in mm | | |
|--|--------------------------------------|------------------|
| N O M I N A L | P I P E S I Z E | P U M P |
| NPS | DN | |
| 1/2" | 12 | 600 |
| 3/4" | 20 | 900 |
| 1" | 25 | 1200 |
| 1 1/2" | 40 | 1200 |
| 2" | 50 | 1500 |
| 2 1/2" | 65 | 1800 |
| 3" | 80 | 2100 |
| 4" | 100 | 3000 |
| 6" | 150 | 4800 |
| 8" | 200 | 6600 |
| 10" | 250 | 8400 |
| 12" | 300 | 10000 |
| 14" | 350 | 11800 |
| 16" | 400 | 13800 |
| 18" | 450 | 16200 |
| 20" | 500 | 18000 |

The heating cables should not touch or cross one another. When prescribed in design apply aluminium tape over the heating cable.

Min. bending radius of the heating cable is 5 x cable diameter.

Note:

Apply additional tiewire/mounting tape in such way that heating cable makes close contact with the pump housing.

THERMON...The Heat Tracing Specialists®

Installation on pipe supports (shoes) bends and flanges

For 2" lines and bigger

Note:
Install the cables on the outside of the bend as shown.

The heating cables should not touch or cross one another.
When prescribed in design apply aluminium tape over the heating cable.
Min. bending radius of the heating cable is 5 x cable diameter.

Note:
In each heating cable a loop must be made on the flange if the pipe diameter allows for this.

Note:

- In process temperature maintenance systems the pipe supports must be isolated from the pipes.
- In winterizing systems Therman highly recommends to isolate the pipe supports from the pipes

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

PAGE 39

Installation on spectacle blinds

For uninsulated spectacle blinds and lines bigger than 2"

Section A-A

The heating cables should not touch or cross one another.
Apply aluminium tape over the heating cable (if applicable)
Min. bending radius of the heating cable is 5 x cable diameter.

Note:

In each heating cable a loop must be made on the flange and, if the pipe diameter allows for this, also extra loops before and after the flange.

THERMON...The Heat Tracing Specialists®

Installation on safety valves

For lines bigger than 6"

(for cable length see valve allowances on page 37)

The heating cables should not touch or cross one another.
When prescribed in design apply aluminium tape over the heating cable.
Min. bending radius of the heating cable is 5 x cable diameter.

Note:

In each heating cable a loop must be made on the flange if the pipe diameter allows for this.
In case of process heating, the valve and the piping upto section A - A to be traced as an individual circuit.

THERMON...The Heat Tracing Specialists®

INSTALLATION INSTRUCTIONS TESH/TES

Installation on manholes

The heating cables should not touch or cross one another.
When prescribed in design apply aluminium tape over the heating cable.
Min. bending radius of the heating cable is 5 x cable diameter.

Note:

First mount the loop in the heating cable by means of tiewire/mounting tape as shown.
No heating cable to be installed on the manhole cover.

THERMON...The Heat Tracing Specialists®

Installation on pressure gauges (sealed type)

The heating cables should not touch or cross one another.
When prescribed in design apply aluminium tape over the heating cable.
Min. bending radius of the heating cable is 5 x cable diameter.

Note:

One heating cable is installed over the gauge, the other heating cable(s) continue(s) straight on.

THERMON...The Heat Tracing Specialists®

Installation on level gauges

THERMON...The Heat Tracing Specialists®

Installation on vessels or tanks

1. Mount banding (not too tight) at the upper side of the vessel or tank.
2. Push the required number of punch strips of sufficient length between the banding and the tank vessel wall. Hang up the punch strips to the banding. The open side of the lips in the punch strip must point downwards (see detail A). Space the punch strips equally over the circumference of the tank with a maximum spacing of 75 cm).
3. Tighten the upper banding.
4. Bend the punch strips to the middle of the tank bottom. Put a tie wire through the last slot of the punch strips. Twist the ends of the tie wire until the punch strips are tight against the wall and bottom (see detail B).
5. First mount a banding at the lower side of the tank and other bandings at a distance from each other of max. 1 meter.
6. Bend the lips of the punch strips upwards where heating cable will be installed.
7. Place the heating cable in the upwards bended lips (the lips are a support only and should not be tightened over the heating cable!!!).
8. Connect the heating/cold lead cables into the power supply box.
9. With a single phase + neutral or a two phase system, the heating cable must be laid out along the tank wall as a loop (so two heating cables parallel to each other).
10. With a three phase system, the end of the three cables must be connected to the endbox, where a star connection can be made.
11. The heating cable must be covered with aluminium tape.

Detail A

Detail B (without heating cable)

Description:

| Tracing material installed in accordance with Thermon TESH/TES installation manual **: | | | Y / N |
| Mechanical cable protection for tracing cables insulation entry installed and mounted watertight to insulation cladding: | | | Y / N |
| Junction box and/or temperature controller/sensor insulation entries sealed off to the insulation cladding: | | | Y / N |
| Tracing caution labels mounted visible on insulation cladding: | | | Y / N |
| Insulation data: | | | |
| Insulation type **: _____ | | | |
| Insulation thickness **: _____ mm | | Insulation size (inner diameter) **: _____ mm | |
| Check settings of temperature controllers / limiters (if applicable): | | | |
| Temperature controllers set at: | 1. | °C | Y / N |
| | 2. | °C | Y / N |
| | 3. | °C | Y / N |
| Temperature limiters set at: | 1. | °C | Y / N |
| | 2. | °C | Y / N |
| | 3. | °C | Y / N |
| Electrical tests (on main feeder junction box 1.): | | | |
| Megger test with 1000 Vdc, result > 10 MΩ | | Resistance test ** | |
| Outgoing tracing cable | Reading | Outgoing tracing cable | |
| L1 or N to earth: | MΩ | L1 to N (or L2 *): | Ω |
| L2 to earth *: | MΩ | L2 to L3 *: | Ω |
| L3 to earth *: | MΩ | L3 to L1 *: | Ω |
| In case TS-01 or TC1/2 thermostats are used in the system disconnect them prior to meggering the heat tracing system. * in case of 3 phase whye circuit configuration | | | |
| Remarks: | | | |
| | | | |
| | | | |
| Approval: | | | |
| Checklist sequence number: _____ | | | |
| Copies to: | | | |
| | | | |
| Installer: | | Installation Supervisor: APPROVED FOR INSULATION | |
| Name: _____ | | CC field inspector: | |
| Company: _____ | | Name: _____ | |
| Date: _____ | | Company: _____ | |
| Signature: _____ | | Date: _____ | |
| | | Signature: _____ | |

** All parameters need to be thoroughly checked with engineering design documents to ensure safety and functionality of stabilised design

Checklist page 4 of 4

| | | | |
|---|---------|---|---------|
| Part 4. Final test: | | | |
| Electrical tests (on main feeder junction box 1.): | | | |
| Megger test with 1000 Vdc, result > 10 MΩ | | Resistance test ** | |
| Outgoing tracing cable | Reading | Outgoing tracing cable | |
| L1 or N to earth: | MΩ | L1 to N (or L2 *): | Ω |
| L2 to earth *: | MΩ | L2 to L3 *: | Ω |
| L3 to earth *: | MΩ | L3 to L1 *: | Ω |
| * in case of 3 phase whye circuit configuration | | | |
| Performance tests: | | | |
| Prior to energising the circuit all above mentioned checks and the checks after installation and insulation are done: | | | Y / N |
| Power supply panel has been commissioned: | | | Y / N |
| All lids of junction boxes and temperature controller/sensor enclosures are closed: | | | Y / N |
| Ambient temperature (when measuring voltage and load/current): | | | °C |
| Line/equipment temperature (if plant is in operation): | | | °C |
| Voltage on main feeder junction box 1. **: | | Outgoing tracing cable | Reading |
| | | L1 to N (or L2 *): | V |
| | | L2 to L3 *: | V |
| | | L3 to L1 *: | V |
| Load measurement on main feeder junction box 1.: | | Outgoing tracing cable | Reading |
| | | No. 1: | A |
| | | No. 2 *: | A |
| | | No. 3 *: | A |
| * in case of 3 phase whye circuit configuration | | | |
| Remarks: | | | |
