

CLEANTEC DX 1G2 SAE 5W-30

Specially designed for modern cars requiring the GM dexos 1™ Gen 2 specification.

Can be used with: API SN; ILSAC GF-5; GM dexos1™ Gen 2

LSPI - low speed pre-ignition is the name for uncontrolled ignitions at low speeds. Due to the downsizing of the engines to increase the efficiency and achieve the exhaust emission values, this problem can increasingly occur during combustion. This mainly affects engines with a small cylinder capacity, turbocharging and gasoline direct injection. When turbocharging, for example, a 1000 cc engine, the volume and degree of filling of a larger engine is simulated by pressing in the air. The more air/fuel mixture is pressed into the engine, the higher the power output. Even small series engines today have power values in the PS / liter ratio which only a few years

ago could be found exclusively in motorsport. The ever-increasing boost pressures in the engines increase the risk that the air-fuel mixture in the combustion chamber ignites automatically. Failure to do so at the time of controlled combustion may result in engine damage. It can come to broken spark plugs, until material breaks out on the piston and cylinder walls, resulting in a major engine failure. This problem has been solved by the OEM manufacturer through a special additive package, therefore, the affected engines may only be filled with the developed oil.
