Galaxy Digital’s \$9B BTC Sale Signals Market Strength

Galaxy Digital’s execution of an 80,000 BTC sale for an early investor is noteworthy for three reasons. First, it’s another reminder for the fallacy of the so-called ‘4-year cycle.’ Forecasters are naturally drawn to the predictability of Bitcoin’s halving cycle, and it may even have had relevance in its early days when the new supply was meaningful in size, but not so in the era of sub-1% BTC inflation rate. Although less predictable, the whales’ behavior is much more relevant supply metrics. Secondly, despite this, the whales alert is ultimately not a reliable signal for consistent alpha generation, as the price is a function of not just supply, but also demand. This is also well-demonstrated in Presto’s analysis, [Whale Alerts: Are They Tradable?](#) Lastly, and most importantly, the entire episode is a testimony to the market maturity. Five years ago, a \$9 billion BTC sale might have sparked panic. Today, the market absorbed it with minimal disruption, reflecting sophisticated participants, robust infrastructure, and institutional adoption through spot ETFs and supportive crypto legislation.
