Why ETF Inflows Aren't Driving BTC Higher

BTC	\$69,650.59	S&P500	5,346.99	US 10Y	4.4512%	WTI	\$75.36
	+0.5%		-0.1%		+0.0102PPT		-0.2%
ETH	\$3,706.32	Nasdaq	17,133.13	DXY	105.06	Gold	\$2,315.40
	+0.7%		-0.2%		+0.2%		-0.4%

- Last Friday, the NFP number came in stronger than expected, with the US economy adding 275k jobs compared to the expected 185k. Following the release, \$BTC saw a sharp decline, falling from 71k to 69k. Currently, \$BTC is trading at \$69,650 and \$ETH at \$3,706.
- Another highlight was Roaring Kitty's livestream, which attracted almost a million viewers, surpassing the FOMC's audience. However, it was uneventful compared to expectations, with \$GME crashing during the stream. As \$GME sold off, memecoins also experienced a sharp decline.
- This week will be significant for macroeconomic events, with the CPI release on Wednesday, the FOMC meeting on Thursday, and a speech from Yellen on Friday.
- During the last 24 hours, the top three gainers were \$TURBO, \$BRETT, and \$BICO, while the top three losers were \$PEOPLE, \$LPT, and \$PRIME.

Why ETF Inflows Aren't Driving BTC Higher

Commonly cited reasons are as follows. First, long-term holders (a.k.a. hodlers), including miners, are selling, as per the onchain data. It could be for multiple reasons - e.g. hodlers sitting on large gains may need cash due to various circumstances. An example is miners under financial stress after the recent halving. Second, the recent ETF inflow may represent one leg of arb traders' positions, with offsetting hedge occurring in the spot market. An example is the basis trade (Long ETF, Short CME Futures), where the build-up of a large short futures position can lead to spot sell pressure via the counterparty. The fact that top two BTC ETF holders are primarily arb-focused hedge funds strengthens this thesis.
