### Basis Trade To Drive Early Inflows Into Spot ETH ETFs?

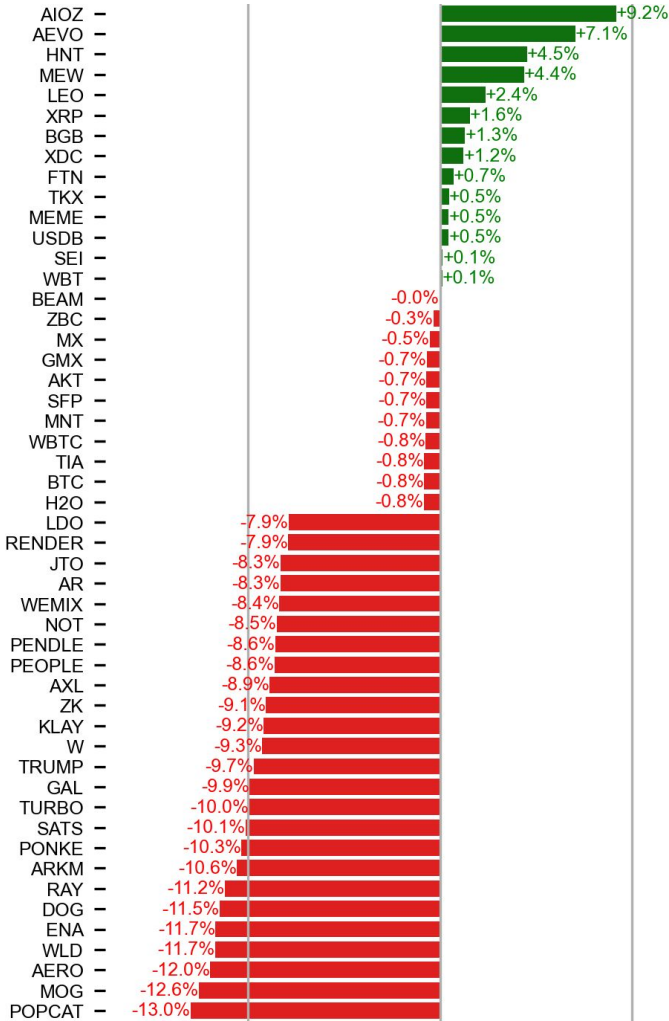

With the spot ETH ETFs set to start trading tonight, the media is busy speculating on the likely ETF inflows. Estimates from the street range from \$1.5 billion to \$25 billion in the first 12 months, while Presto's base-case scenario is at \$3.6 billion (see [Modeling Spot ETH ETF Inflows](#) for more). Putting aside the question of ETH's viability as a legitimate institutional asset, one near-term driver for the inflow will be the demand from arb traders looking to capture the basis trade opportunity (i.e., Long spot ETF, Short CME futures). Experience with the spot BTC ETFs has shown that as much as 1/3 of the ETF inflows may be attributed to basis trade on any given day. The trade is profitable as long as the annualized basis on CME futures stays meaningfully above the risk-free rate. This is indeed the case currently with CME ETH futures, trading at 9.6% versus the 5.2% 3-month T-bill rate.
