Study was sponsored by Eli Lilly and Company

OBJECTIVE

To compare the pharmacokinetics (PK) and safety of imlunestrant in women of nonchildbearing potential with hepatic impairment to those with normal hepatic function.

CONCLUSIONS

- Imlunestrant administered as a single oral dose in the fasted state was well tolerated in healthy FONCBP, as well as patients with mild, moderate and severe hepatic impairment (as determined by the Child Pugh's classification).
- There were no significant differences in the exposure profiles of imlunestrant in patients with mild hepatic impairment in comparison to participants with normal hepatic function.
- Patients with moderate and severe hepatic impairment presented significant increases in imlunestrant AUC (but not C_{max}) when compared with normal hepatic function.
- These data will inform imlunestrant dosing recommendations for patients with hepatic impairment

San Antonio Breast Cancer Symposium (SABCS); San Antonio, TX; Dec 10-13, 2024

wang_xuejing@lilly.com

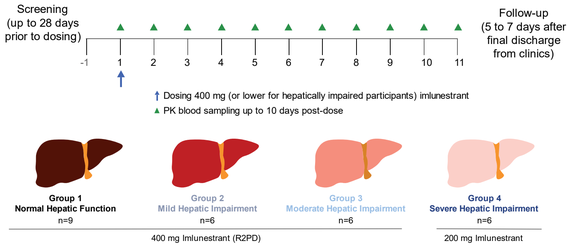
BACKGROUND

- Imlunestrant is a next-generation, oral selective estrogen receptor degrader designed to provide continuous ER-target inhibition, aimed to improve outcomes for patients with ER+ advanced breast and endometrial cancers.[1,2]
- Imlunestrant is mostly excreted in the feces and has an absolute bioavailability of ~10%.[3]
- Hepatic impairment (HI) is a common condition, especially among cancer patients, and it can modify the pharmacokinetics (PK) of anticancer drugs, impacting their safety.[4]
- Considering that the intended patient population for imlunestrant may include cancer patients with HI, it is essential to evaluate whether HI affects the imlunestrant PK and safety profile.
- Here we present PK and safety data for imlunestrant in postmenopausal females of nonchildbearing potential (FONCBP) with and without HI, following a single oral dose in a fasted state.

METHODS/STUDY DESIGN

- **Primary Objective**:
  - PK parameters based on Child-Pugh Classification
    - AUC(0-∞), and
    - Cmax
  - Exploratory analysis using NCI classification of HI
- **Secondary Objective**: Safety
- **Data cut-off date used for this analysis was February 1st 2024**

Child-Pugh classification: investigator assessed score calculated based on the sum of 5 parameters: serum albumin, total serum bilirubin, prothrombin time, ascites and hepatic encephalopathy



KEY ELIGIBILITY CRITERIA

- >18 years of age
- BMI: 18.0-42.0 kg/m2
- Female participants of non-childbearing potential
- **In addition, for Groups 2-4**
  - Investigator assessed Child-Pugh class A, B, or C (mild, moderate or severe)
  - Chronic Hepatic Impairment diagnosis (>6 months)

National Cancer Institute (NCI) classification: comprises total bilirubin and glutamic-oxaloacetic transaminase/aspartate aminotransferase ratio

RESULTS
