1 INTRODUCTION

This release introduces improvements to the last production release, version 26.7.0. The new release version is 26.10.1.

It adds clearer payment-scheme selection for co-branded cards, Dynamic Currency Conversion for referenced refunds, and improvements to cashback and payment handling.

This release supports the following payment terminals:

Terminal model	Minimum firmware version
N950	190
P300	140
P70	168

Feature availability depends on terminal firmware and service configuration.

For release availability and assistance with your terminal, contact your usual Nets support channel.

2 NEW FEATURES

2.1 Consumer Choice for co-branded cards

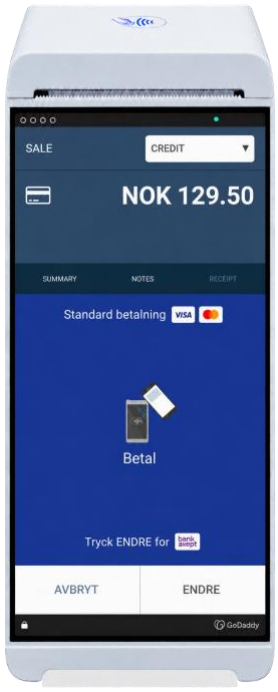

For configured co-branded Dankort and BankAxept card payments, the payment screen clearly displays the merchant's preferred scheme and the available alternatives. Cardholders can keep that preference or press Change before presenting their card to use an alternative scheme supported by their card and the merchant.

This makes the merchant's preference visible while preserving the single-tap contactless flow when one eligible scheme can be selected. If further scheme selection is needed, the terminal may ask the cardholder to choose a scheme and tap again.

This screen is shown only for merchants with both domestic and international card acceptance. The change affects only co-branded cards carrying both domestic and international payment schemes. Payment behaviour remains unchanged for other payment cards.

Illustrative example of the merchant's domestic preference: BankAxept.

Illustrative example of the merchant's international preference: Visa and Mastercard.

On N950, the new interface requires firmware version 202 or later. Older N950 firmware retains the existing card-selection behavior.

2.2 Dynamic Currency Conversion for referenced refunds

When Dynamic Currency Conversion is enabled, an integrated cash register can request a refund linked to the original payment in the cardholder's currency. If the currency-conversion service is unavailable, the refund continues in the merchant's currency.

3 IMPROVEMENTS

- **Cashback availability.** The Cashback option on the amount-entry screen is shown only when cashback is enabled in the merchant's active settlement contract.
- **Clearer cashback messages.** The terminal now explains when cashback is declined because it is not enabled or the permitted limit has been exceeded.
- **Software version on the Welcome screen.** The installed SmartPOS version is displayed to help store and support staff identify the software release.
- **Reduced contactless payment delay.** Approved contactless payments can proceed with less delay when no cardholder choice, currency-conversion request, or loyalty step is needed.

4 DEFECTS AND ISSUES FIXED

- **Settlement currency.** Fixed incorrect "Unsupported currency" declines when an expired settlement contract used a different currency from the active contract.
- **Payment retry amount.** Retrying a payment after a duplicate payment request reported that a transaction was already in progress no longer resets the amount to zero.
- **Visa refunds.** Fixed certain Visa chip and contactless refunds that did not complete after the refund had been accepted.
- **BankAxept mobile confirmation.** When mobile passcode confirmation is required, the transaction now ends with "Enter pin on phone and retry" instead of requesting the card again.
- **BankAxept offline PIN.** BankAxept chip payments no longer use plaintext offline PIN. When supported by the card, an enciphered PIN method is used.

5 SECURITY AND COMMUNICATIONS

Terminal connections to the payment Gateway now prefer TLS 1.3 when supported, with TLS 1.2 used when needed.

6 AVAILABILITY AND SUPPORT

For release availability or assistance with your terminal, contact your usual Nets support channel. Feature availability depends on terminal model, firmware, and service configuration.
