

# Trimble Ag Software—Business

## License for managing a farming business

Trimble® Ag Software is powerful cloud, office and mobile farm management software from Trimble Agriculture. With the Trimble Ag Software—Business license, farmers get all the benefits of other TAS licenses like Field Manager, Work Orders, AutoSync™, Direct Send as well as additional features that enable profitable agronomic planning and farm management, including Crop Health Imagery, grid or zone soil sampling workflows, grain contract management and enhanced recordkeeping, reporting and analysis of all business operations.

Trimble Ag Software—Business offers flexibility and interoperability to make production agriculture easier and more effective right from the start. Our systems help growers connect all the equipment on their farm, generating stronger results across all aspects of the business. As more and more farmers embrace precision agriculture practices, accurate planning, tracking, data collection and record keeping become ever more critical to maximize yields and achieve profitable outcomes.

Crop inputs are one of the biggest investments on the farm. Understanding the per-area cost of seed, fertilizer and crop protection inputs is critical as they can have a huge impact on profitability. Trimble Ag Software—Business removes the manual calculations and guesswork, giving users confidence in the value of a field application by making operating costs fully transparent. Trimble Ag Software calculates the cost per area for each field throughout the growing season. Each report includes critical information such as expenses, landlord splits, profit/loss and more.

### Key Benefits

- Identify fields' needs before starting work with historical record analysis, inventory management and agronomic planning
- Increase in-field work time and reduce operator error with field resources delivered by AutoSync or Direct Send
- Work ahead of operators to plan and deliver tomorrow's Work Orders today
- Stay on top of equipment usage and reduce work delays with fleet tracking
- Maximize profitability with commodity pricing, bin monitoring and grain contract management
- Save time every day with automatic collection and cloud upload of as-applied data
- Ease the burden of compliance requirements with auto-generated reports and direct data sharing capabilities

# Trimble Ag Software—Business

## License for managing a farming business

Trimble Ag Software—Business enables farmers and their partners to scout fields and develop in-depth agronomic records, helping farmers monitor their crop performance during the growing season. Working within the Trimble Ag Software ecosystem, these scouting records can be turned into application recommendations to address potential issues when they are discovered, leading to healthier crops, potentially reduced inputs and overall higher yields. Scouting is further improved using Crop Health Imagery which allows farmers to compare crop health at each growing stage for targeted in-field crop scouting. This enables smart in-season application decisions, helping farmers maximize yields and drive profits.

Running out of a key product right when it's needed can dramatically impact farm productivity. Trimble Ag Software—Business allows users to keep track of purchases and usage of all materials throughout the season simply by entering the purchase amount and price. As tasks are completed, the corresponding inventory stock is reduced, making it easy to monitor product levels and ensure enough inputs are available to complete planned applications (or Work Orders) before they begin. This inventory reporting allows farmers to easily make in-season purchase decisions, and plan ahead for future season's purchases as well.

Advanced record keeping is a must for every profitable farm. Trimble Ag Software—Business both automatically collects field records from connected displays and makes it easy to track completed work manually. By tracking all operations performed, costs and input usage are able to be quickly calculated and turned into performance reports, historical records, regulatory compliance reports and facilitate planning for the next day's Work Orders as well as next year's crop.

Trimble Ag Software—Business simplifies harvest and profit tracking activities. By monitoring harvest events across the entire farm operation, including yield data and commodity prices, the costs of production can be determined and projected costs compared to actual performance. Next profitability, product usage and scouting event reports are just a few clicks away. Trimble's Yield Data Cleaning tool makes it even easier and more accurate to look at costs and determine areas of profitability. The tool automatically fixes issues with grain flow delays, positioning errors, sensor errors and overlaps, saving you countless hours manually fixing them field-by-field.

### Key Features

- Field Manager resource creation
- AutoSync or Direct Send resource sharing
- Work Order and prescription creation and sending
- Field map data layering for record keeping, reporting and profitability analysis
- Crop scouting with Crop Health Imagery
- Employee time tracking
- Soil sampling and zone management
- Yield Data Cleaning tool
- Field-level weather
- Commodity pricing, bin monitoring and grain contract management
- Profit mapping, crop planning and additional financial and accounting reports to improve agronomy decisions
