

Trimble Ag Software

Connected precision ag data management

Trimble® Ag Software solutions offer a range of operational, record-keeping, agronomic and connectivity features to help farming businesses focus on what's most important — getting the work done correctly and efficiently. Trimble Ag Software helps farmers more effectively manage their farm data, operations and business, through technology that connects the machine to the cloud, streamlining operational workflows for each phase of the crop production cycle.

Field Manager

Create, manage and share resources for field work from the office, a tractor cab or anywhere with an internet connection. Farmers can manage all their field data from within Trimble Ag Software.

Direct Send

Deliver the exact resources needed to perform field work (such as boundaries, guidance lines and implement profiles) directly to an individual device and vehicle, eliminating the need to manually move data with USB drives.

AutoSync

The AutoSync™ feature automatically syncs fields, boundaries, guidance lines, landmarks, materials, vehicles, implements and operator information across all connected devices.

Work Orders

Designed to streamline your workflows, Work Orders are a set of instructions for completing in-field tasks that are created on the web and then synced to Precision-IQ™ field application displays to simplify remote task setup.

Third-party data integration

Trimble Ag Software supports data compatibility, connectivity and data exchange with other third-party farm management software platforms, including those from Raven, AGCO, John Deere, Case IH, New Holland, and more.

Key Benefits

- Access real-time information to more effectively run operations
- Organize display data to ensure field work is executed correctly
- Save time collecting and sharing job data from the display
- Optimize operational efficiency by managing daily work and monitoring field activities

USER LICENSE FEATURE COMPARISON
