#### Disclaime

The document may only be used for the purposes for which it was commissioned and in accordance with the Terms of the Engagement for the commission. This report and all information contained within is rendered void if any information herein is altered or reproduced without the permission of Narla Environmental. Unauthorised use of this document in any form whatsoever is prohibited. This report is invalid for submission to any third party or regulatory authorities while it is in draft stage. Narla Environmental Pty Ltd will not endorse this report if it has been submitted to council while it is still in draft stage. This document is and shall remain the property of Narla Environmental Pty Ltd. The sole purpose of this report and the associated services performed by Narla Environmental was to undertake a Flora and Fauna Assessment for an activity under Part 5 of the EP&A Act in accordance with the scope of services set out in the contract between Narla Environmental and the client who commissioned this report. That scope of services, as described in this report, was developed with the client who commissioned this report. Any survey of flora and fauna will be unavoidably constrained in a number of respects. In an effort to mitigate those constraints, we applied the precautionary principle described in the methodology section of this report to develop our conclusions. Our conclusions are not therefore based solely upon conditions encountered at the site at the time of the survey. The passage of time, manifestation of latent conditions or impacts of future events may require further examination of the project and subsequent data analysis, and re-evaluation of the data, findings, observations and conclusions expressed in this report. Narla Environmental has prepared this report in accordance with the usual care and thoroughness of the consulting profession, for the sole purpose described above and by reference to applicable standards, guidelines, procedures and practices at the date of issue of this report. For the reasons outlined above, however, no other warranty or guarantee, whether expressed or implied, is made as to the data, observations and findings expressed in this report, to the extent permitted by law. This report should be read in full and no excerpts are to be taken as representative of the findings. No responsibility is accepted by Narla Environmental for use of any part of this report in any other context. The review of legislation undertaken by Narla Environmental for this project does not constitute an interpretation of the law or provision of legal advice. This report has not been developed by a legal professional and the relevant legislation should be consulted and/or legal advice sought, where appropriate, before applying the information in particular circumstances. This report has been prepared on behalf of, and for the exclusive use of, the client who commissioned this report, and is subject to and issued in accordance with the provisions of the contract between Narla Environmental and the client who commissioned this report. Narla Environmental accepts no liability or responsibility whatsoever for, or in respect of, any use of, or reliance upon, this report by any third party. Narla Environmental Pty Ltd has completed this assessment in accordance with the relevant federal, state and local government legislation as well as current industry best practices including guidelines. Narla Environmental Pty Ltd accepts no liability for any loss or damages sustained as a result of reliance placed upon this report and any of its content or for any purpose other than that for which this report was intended

# Glossary

Acronym/ Term	Definition			
BAM	Biodiversity Assessment Method			
BC Act	New South Wales Biodiversity Conservation Act 2016			
Biodiversity values	The composition, structure, and function of ecosystems, including threaten species, populations and ecological communities, and their habitats			
CEMP	Construction Environmental Management Plan			
СРСР	Cumberland Plain Conservation Plan			
DA	Development Application			
DCP	Mamre Road Precinct Development Control Plan 2021			
Development	The use of land, and the subdivision of land, and the carrying out of a work, and the demolition of a building or work, and the erection of a building, and any other act, matter or thing referred to in section 26 that is controlled by an environmental planning instrument but does not include any development of a class or description prescribed by the regulations for the purposes of this definition (EP&A Act 1979).			
DPE	Department of Planning and Environment			
DPI	Department of Primary Industries			
DPIE	Department of Planning, Industry and Environment (now known as DPE)			
EHG	Environment and Heritage Group			
EP&A Act	Environmental Planning & Assessment Act 1979			
EPBC Act	Environment Protection and Biodiversity Conservation Act 1999			
FFA	Flora and Fauna Assessment			
ha Hectares				
km	Kilometre			
IPA Inner Protection Area				
LGA	Local Government Area			
Locality A 10km x 10km cell centred on the Project Area				
m	metres			
Native Vegetation	Any of the following types of plants native to New South Wales: (a) trees (including any sapling or shrub), (b) understorey plants, (c) groundcover (being any type of herbaceous vegetation) and (d) plants occurring in a wetland.			
OEH	Office of Environment and Heritage (now known as the DPE)			
SEPP	State Environmental Planning Policy			
SEPP (I&E)	State Environmental Planning Policy (Industry and Employment) 2021			
Project Area	The footprint of the proposed activity.			
Threatened species, populations, and cological communities	Species, populations, and ecological communities specified in Schedules 1 and 2 or the BC Act 2016.			

# 1. Introduction

#### 1.1 Project Background

Narla Environmental Pty Ltd (Narla) was commissioned by AT&L to undertake a Flora and Fauna Assessment (FFA) for the proposed activity along Mamre Road, Kemps Creek. The proposed activity aims to upgrade Mamre Road, as well as upgrade the Mamre and Abbotts Roads intersection and to provide for the development of land within the Mamre Road Precinct (AT&L 2024; **Appendix A**). All areas associated with the proposed activity are hereafter referred to as the 'Project Area' (**Figure 1**), including:

- Widening the road beyond the existing road reserve (either side on Mamre Road);
- Signalised intersections;
- Earthworks including raising and lowering the road;
- Stormwater (new and larger culverts under and adjacent to road);
- Relocation of services (above and underground);
- New services (incl water, power, comms).
- Site sheds, material storage as required for road construction project; and
- Temporary works buffer as necessary to facilitate construction.

Narla have produced this report to assess any potential impacts associated with the proposed activity on terrestrial ecology (biodiversity), particularly threatened species, populations and ecological communities listed under the Biodiversity Conservation Act 2016 (BC Act) and Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act). The report will also recommend appropriate measures to mitigate any potential impacts in line with all relevant State Environmental Planning Policies (SEPP), and state and local government plans, namely the Mamre Road Precinct Development Control Plan (DCP) 2021.

### 1.2 Site Description and Location

The Project Area is located on gently undulating terrain and is located within a rural setting, covering an area of approximately 5.51ha within the Penrith Local Government Area (LGA). The Project Area stretches 1.2km along Mamre Road, incorporating the intersection with Abbots Road. The Project Area is composed of mainly exotic-dominated grasslands and paddocks, with sporadic intervals of hardstand and select native trees. The Project Area is bordered by continuous stretches of rural residences and paddocks.

#### 1.2.1 Topography, Geology and Soil

The Project Area ranges from 42m to 44m above sea level (asl; Google 2024). The Project Area is situated on the 'Blacktown' soil landscape as described in the Soil Landscapes of the Penrith 1:100,000 sheets (Bannerman and Hazelton 2011).

The Blacktown soil landscape is characterized by gently undulating rises on Wianamatta Group shales, with local relief to 30 m and slopes usually >5%. The geology consists of Wianamatta Group—Ashfield Shale comprising of laminite and dark grey siltstone, Bringelly Shale which consists of shale with occasional calcareous claystone, laminite and infrequent coal, and Minchinbury Sandstone consisting of fine to medium-grained quartz lithic sandstone. Soils are shallow to moderately deep (>100cm) hardsetting mottled texture contrast soils and Brown Podzolic Soils on crests, grading to Yellow Podzolic Soils on lower slopes and drainage lines. The Project Area is not mapped as having any risk of acid sulfate soils.

#### 1.2.2 Hydrology

The Project Area overlaps with one (1) second order watercourse, along with its associated 20m riparian buffer zones (**Figure 2**). This watercourse was in low condition, with the only habitat present being a degraded culvert and exotic vegetation around a soak. No additional unmapped water features were observed within the Project Area. One (1) mapped hydroarea (dam) was also identified within the Project Area (**Figure 2**).

#### 1.3 Scope of Assessment

The objectives of this FFA were to:

- Establish the likelihood of occurrence of migratory species, threatened species, endangered populations, and threatened ecological communities as listed under the New South Wales BC Act and/or the Commonwealth EPBC Act;
- Assess any potential impacts to species and/or communities listed under the BC Act and EPBC Act;
- Identify and map the distribution of vegetation communities within the Project Area;
- Record the presence and extent of any known or potential fauna habitat features such as nests, dreys, caves, crevices, culverts, pools, soaks, flowering trees, fruiting trees, hollow-bearing trees and provide recommendations for on-going management of these habitat features and any fauna present;
- Record the presence and extent of any priority weeds or weed infestations and provide recommendations for on-going management; and
- Recommend any controls or additional actions to be taken to protect or improve environmental outcomes of the proposed activity.

#### 1.4 Study Limitations

This study was not intended to provide a complete inventory of all flora and fauna species with potential to occur on the Project Area. The timing of the surveys may not have coincided with emergence times of some species of flora and fauna, such as seasonally flowering herbs, seasonal migratory fauna, or nocturnal fauna.

To account for those species that could not be identified during the field survey, detailed habitat assessments were combined with desktop research and local ecological knowledge to establish an accurate prediction of the potential for such species to occur on or adjacent to the Project Area.

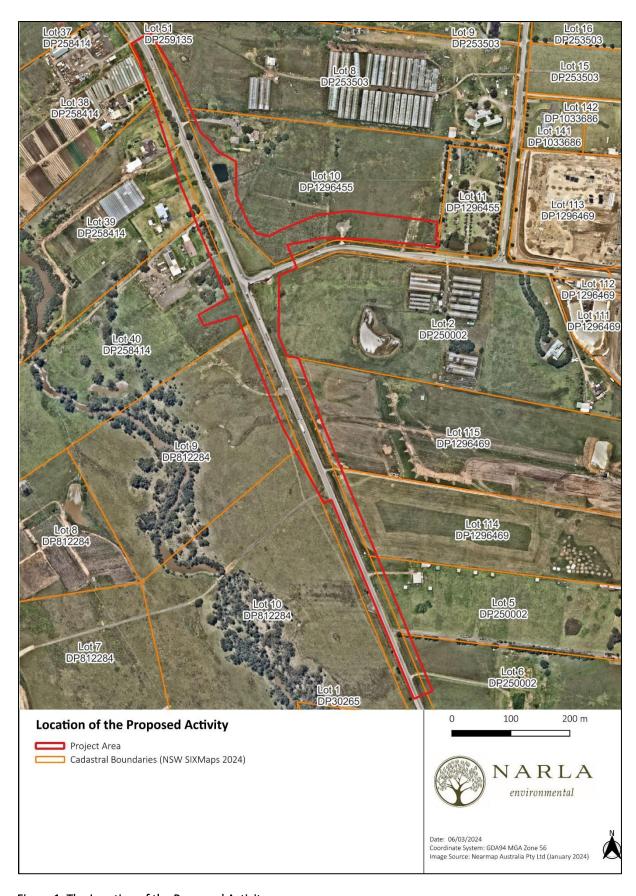

Figure 1. The Location of the Proposed Activity.

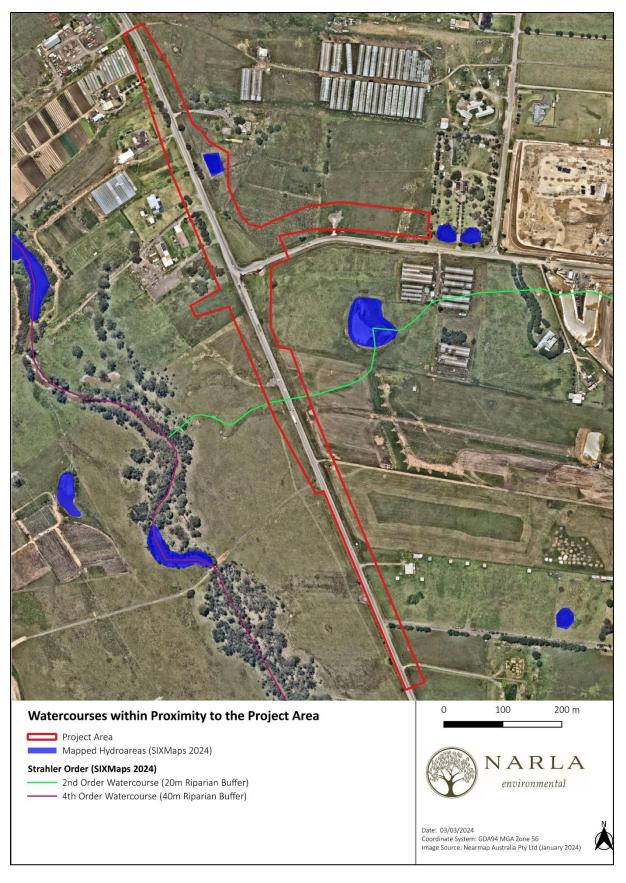

Figure 2. Watercourses and their associated Riparian Buffers within the Project Area.

## 1.5 Relevant Legislation and Policy

The legislation and policy that are addressed in this report are listed in **Table 1**.

Table 1. Relevant legislation and policy addressed.

Legislation/ Policy	Relevant Ecological Feature on Site	Triggered	Action Required
Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) (Commonwealth)	Potential suitable habitat was considered present for the EPBC Act listed Vulnerable fauna species, <i>Litoria aurea</i> (Green and Golden Bell Frog).  The native vegetation within the Project Area did not meet the listing advice for protection under the EPBC Act.  No EPBC Act listed fauna or flora species were identified within Project Area: EPBC Act listed threatened species have the potential to occur within the Project Area.	Yes	This FFA, particularly the likelihood tables for threatened fauna and flora species occurring or potentially occurring within the Project Area, as well as severity of potential impacts.  An assessment of Significant Impact Criteria was undertaken in accordance with Commonwealth Environment Protection and Biodiversity Conservation Act 1999 to assess potential impacts from the proposed activity on Green and Golden Bell Frog (Appendix F).
New South Wales Biodiversity Conservation Act 2016 (BC Act)	One (1) BC Act listed Ccritically Endangered Ecological Community (CEEC) occurs within the Project Area:  • Cumberland Plain Woodland in the Sydney Basin Bioregion  Potential suitable habitat was considered present for the BC Act listed Endangered fauna species, Litoria aurea (Green and Golden Bell Frog).  No BC Act listed fauna or flora species were identified within the Project Area. BC Act listed threatened species have the potential to occur within the Project Area.  Part of the Project Area has been nominated as 'Certified-urban capable land' under the Cumberland Plain Conservation Plan (CPCP). Development in these areas do not require further biodiversity assessment under the BC Act. However, other parts of the Project Area that are mapped as 'Excluded Land' or 'Avoided Land' under the CPCP still require biodiversity approval under the BC Act.	Yes	This FFA, particularly the likelihood tables for threatened fauna and flora species occurring or potentially occurring within the Project Area, as well as severity of potential impacts.  A Test of Significance (5-part Test) was undertaken in accordance with the BC Act to assess potential impacts from the proposed activity on the CEEC (Appendix D) as well as Green and Golden Bell Frogs (Appendix E)
Biosecurity Act 2015 (Bio Act)	Three (3) Priority Weeds were identified within the Project Area:  • Olea europaea subsp. cuspidata (African Olive);	Yes	All priority weeds must be managed in accordance with the Biosecurity Act

Legislation/ Policy	Relevant Ecological Feature on Site	Triggered	Action Required
	<ul> <li>Rubus fruticosus species aggregate (Blackberry); and</li> <li>Senecio madagascariensis (Fireweed).</li> </ul>		
Environmental Planning and Assessment Act 1979 (EP&A Act)	All threatened species, populations and ecological communities and their habitat that occur or are likely to occur on the Subject Property during a part of their lifecycle.	Yes	This FFA and all subsequent recommendations relevant to the planning process under 'Part 4: Development assessment and consent'.
State Environmental Planning Policy (Biodiversity and Conservation) 2021 – Chapter 4 Koala Habitat Protection 2021	Penrith City Council is not listed in Schedule 2 of the SEPP as one of the LGAs to which this chapter applies. Therefore Chapter 4 of the SEPP does not apply to the proposed activity.	No	None.
State Environmental Planning Policy (Resilience and Hazards) 2021 - Chapter 2 Coastal Management	The Project Area does not contain areas mapped as 'Coastal Wetlands,' 'Littoral Rainforest,' or proximity to either, therefore, Chapter 2 of this SEPP does not apply.	No	None
Water Management Act 2000	As the proposed works intersect a mapped water course this Act Applies.	Yes	Controlled Activity approval may be required.

#### 1.6 Cumberland Plain Conservation Plan

### 1.6.1 Biodiversity Conservation Act 2016

Part of the Project Area has been nominated as 'Certified-urban Capable Land' under the Cumberland Plain Conservation Plan (CPCP). Development in these areas do not require further biodiversity assessment under the BC Act. However, other parts of the Project Area that are mapped as 'Excluded Land' or 'Avoided Land' still require biodiversity assessment under the BC Act (Figure 3). Therefore, all impacts to vegetation located within 'Certified-urban Capable Land' has not been assessed has not been assessed within this report. BC Act Tests of Significant (5-part Tests) have been conducted for areas of Cumberland Plain Woodland (Appendix D), as well as habitat for Green and Golden Bell Frogs, which were located with areas mapped under the CPCP as 'Excluded Land' (Appendix E).

#### 1.6.2 Environment Protection and Biodiversity Conservation Act 1999

The Department of Planning and Environment is currently pursuing Commonwealth approval for the CPCP under Part 10 of the EPBC Act. Landholders can submit development applications, seek subdivision or start master planning. However, development that will have a significant impact on matters of national environmental significance (MNES) on certified - urban capable land cannot commence until the Commonwealth CPCP approval is in place. The Cumberland Plain Woodland located within the Project Area was found to not meet the listing advice for protection under the EPBC Act however, an assessment of significant impact on the EBPC listed Green

and Golden Bell Frog has been conducted as part of this proposal (**Appendix F**) and it was determined that no significant impact was likely.

#### 1.7 Biodiversity Assessment Pathway

The requirements of the BC Act 2016 and Biodiversity Conservation Regulation 2017 are mandatory for all development applications assessed pursuant to Part 4 of the Environmental Planning and Assessment Act 1979 (EP&A Act) submitted in the Penrith City Council LGA.

The Biodiversity Values (BV) Map (DPE 2024a) identifies land with high biodiversity values that are particularly sensitive to impacts from development and clearing. The map forms part of the Biodiversity Offsets Scheme Entry Threshold which is one of the triggers for determining whether the Biodiversity Offset Scheme (BOS) applies to a clearing or development proposal. The Project Area does not contain any areas mapped on the Biodiversity Values (BV) Map.

No minimum lot size is prescribed by the LEP to the Project Area. Therefore, the total size of the smallest lot is utilised to determine the clearing threshold for the project. The smallest lot intersected by the proposed activity was found to be in the 1ha to less than 40ha category, meaning that to avoid triggering the BOS, the proponent must avoid clearing 0.5ha or more of native vegetation (**Table 2**). As the proposed activity will only impact 0.23ha, of native vegetation not located within areas identified as 'Certified-urban Capable Land', the clearing threshold is not exceeded and the BOS does not apply.

Table 2. Biodiversity Offset Scheme Entry Thresholds. Bold text indicates the threshold relevant to this assessment.

Minimum lot size associated with the property	Threshold for clearing, above which the BAM and offsets scheme apply
Less than 1 ha	0.25ha or more
1 ha to less than 40 ha	0.50ha or more
40 ha to less than 1000 ha	1ha or more
1000ha or more	2ha or more

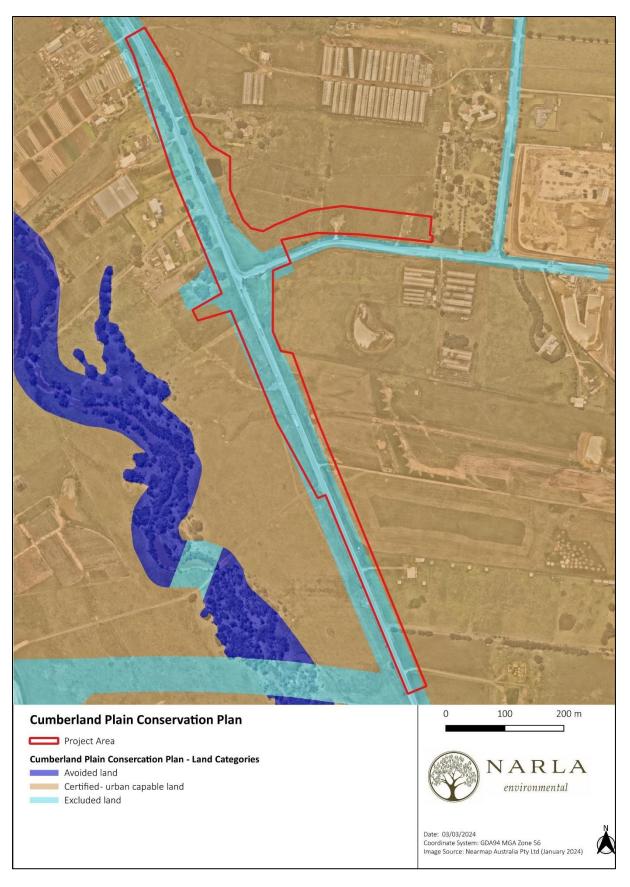

Figure 3. Cumberland Plain Conservation Plan.

## 1.8 State Environmental Planning Policy: Industry and Employment 2021

The proposed activity will be undertaken in a manner that meets the requirements of the SEPP (I&E).

#### 1.8.1 Zoning

The Project Area contains land that is zoned as 'IN1: General Industrial' and 'SP2: Infrastructure'. The SEPP requires that the development satisfies the zone objectives, which are:

#### Zone IN1: General Industrial

- o To facilitate a wide range of employment-generating development including industrial, manufacturing, warehousing, storage and research uses and ancillary office space;
- $_{\circ}$   $\,$  To encourage employment opportunities along motorway corridors, including the M7 and M4;
- o To minimise any adverse effect of industry on other land uses;
- o To facilitate road network links to the M7 and M4 Motorways;
- To encourage a high standard of development that does not prejudice the sustainability of other enterprises or the environment; and
- To provide for small-scale local services such as commercial, retail and community facilities (including child care facilities) that service or support the needs of employment-generating uses in the zone.

#### Zone SP2: Infrastructure:

- To provide for infrastructure and related uses.
- o To prevent development that is not compatible with or that may detract from the provision of infrastructure.

# 2. Methodology

### 2.1 Desktop Assessment and Literature Review

A thorough literature review of local information relevant to the Penrith LGA was undertaken. Searches using NSW Wildlife Atlas (BioNet; DPE 2024b) and the Commonwealth Protected Matters Search Tool (DCCEEW 2024) were conducted to identify all current threatened flora and fauna, as well as migratory fauna records within a 10km x 10km cell centred on the Project Area. These data were used to assist in establishing the presence or likelihood of any ecological values as occurring on or adjacent to the Project Area and helped inform our Ecologist on what to look for during the site assessment.

Soil landscape and geological mapping was examined to gain a deeper understanding of the geology of the Project Area that assists in determining whether any threatened flora or ecological communities may occur (Kovac & Lawrie,1991).

#### 2.2 Ecological Site Assessment

#### 2.2.1 General Survey

A site assessment was undertaken by Narla Ecologists Jayden Maloney and Hannah Martin on the 9<sup>th</sup> and 10<sup>th</sup> of February 2023, and the 14<sup>th</sup> and 15<sup>th</sup> of March 2023. An additional site assessment was then conducted by Narla Ecologist Chris Moore and Kayla Spithoven on the 1<sup>st</sup> of March 2024. During the site assessments, the following activities were undertaken:

- Identifying and recording the vegetation communities within the Project Area, with focus on identifying any threatened ecological communities (TECs);
- Recording a detailed list of flora species encountered within the Project Area, with a focus on threatened species, species diagnostic of threatened ecological communities and Priority Weeds;
- Recording opportunistic sightings of any fauna species seen or heard on or within the immediate surrounds of the Project Area;
- Targeted surveys for threatened flora;
- Identifying and recording the locations of notable fauna habitat such as important nesting, roosting or foraging microhabitats;
- Targeting the habitat of any threatened and regionally significant fauna including:
  - Tree hollows (habitat for threatened large forest owls, parrots, and arboreal mammals);
  - Caves and crevices (habitat for threatened reptiles, small mammals, and microbats);
  - Termite mounds (habitat for threatened reptiles);
  - Soaks (habitat for threatened frogs);
  - Wetlands (habitat for threatened fish, frogs, and water birds);
  - Drainage lines (habitat for threatened fish and frogs);
  - Fruiting trees (food for threatened frugivorous birds and mammals);
  - o Flowering trees (food for threatened nectarivorous mammals and birds);
  - Trees and shrubs supporting nest structures (habitat for threatened birds and arboreal mammals); and
  - Any other habitat features that may support fauna (particularly threatened) species.
- · Assessing the connectivity and quality of the vegetation within the Project Area and surrounding area.

#### 2.2.2 Weather Conditions

Weather conditions recorded at the nearest weather station prior to and during the general flora and fauna survey period are provided in **Table 3** (BOM 2024). This data reveals little to no rainfall and hot conditions leading up to

each survey, which is unlikely to have a significant effect on triggering the emergence/flowering of threatened species that could potentially occur within the Project Area.

Table 3. Weather conditions recorded at Badgerys Creek AWS (station 067108) preceding and during the survey periods (survey dates in bold).

Survey Type	Survey date	Day	Minimum Temp. (°C)	Maximum Temp. (°C)	Rainfall (mm)

## 2.3 Mapping and Analysis of Vegetation Communities

Narla examined local satellite imagery, geological mapping, soil landscape mapping and topographic mapping, in addition to existing vegetation mapping (DPE 2022) in order to stratify the Project Area and guide the site

assessment survey efforts. The following resources were consulted during the site assessment to assist with the identification of vegetation communities present within the Project Area:

- eSPADE v2.2 (DPE 2024d);
- Soil Landscapes of the Penrith 1:100,000 sheet (Bannerman and Hazelton 2011);
- State Vegetation Type Mapping (DPE 2022).

### 2.4 Impact Assessment

Locally occurring threatened species (as per DPE 2024b) were assessed for their potential to occur within the Project Area (**Table 8**; **Table 10**). It was then determined whether a further impact assessment (test of significance; 5-part test and/or an Assessment of Significant Impact Criteria) was required.

An assessment of Significance (5-part Test) was carried out for the BC Act listed Critically Endangered Ecological Community (CEEC), Cumberland Plain Woodland in the Sydney Basin Bioregion that is not within Certified-urban capable land under CPCP (**Appendix D**) as well as for *Litoria aurea* (Green and Golden Bell Frog; **Appendix E**). An Assessment of Significant Impact Criteria was also carried out for *Litoria aurea* (Green and Golden Bell Frog; **Appendix F**).

# 3. Native Vegetation

### 3.1 Vegetation Community

#### 3.1.1 Historically Mapped Vegetation Communities

Based on historical vegetation mapping, two (2) vegetation communities are present within the Project Area (DPE 2022; **Figure 4**):

- PCT 3448: Castlereagh Ironbark Forest; and
- Non-native Vegetation.

PCT 3448 conforms to the BC listed EEC, Cooks River/Castlereagh Ironbark Forest in the Sydney Basin Bioregion, and the EPBC Act listed CEEC, Cooks River/Castlereagh Ironbark Forest of the Sydney Basin Bioregion.

### 3.1.2 Field Validated Vegetation Communities

Field survey conducted by the Narla Ecologists identified two (2) vegetation communities within the Project Area (Figure 5):

- Cumberland Shale Plains Woodland (Table 4); and
- Exotic Vegetation (Table 5).

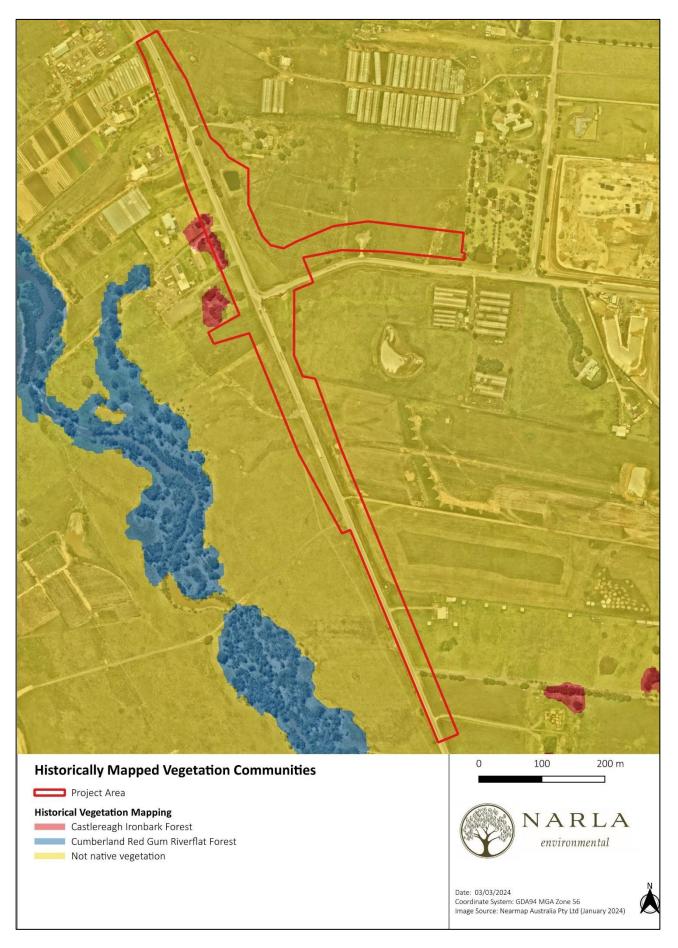

Figure 4. Historically Mapped Vegetation Communities (DPE 2022).

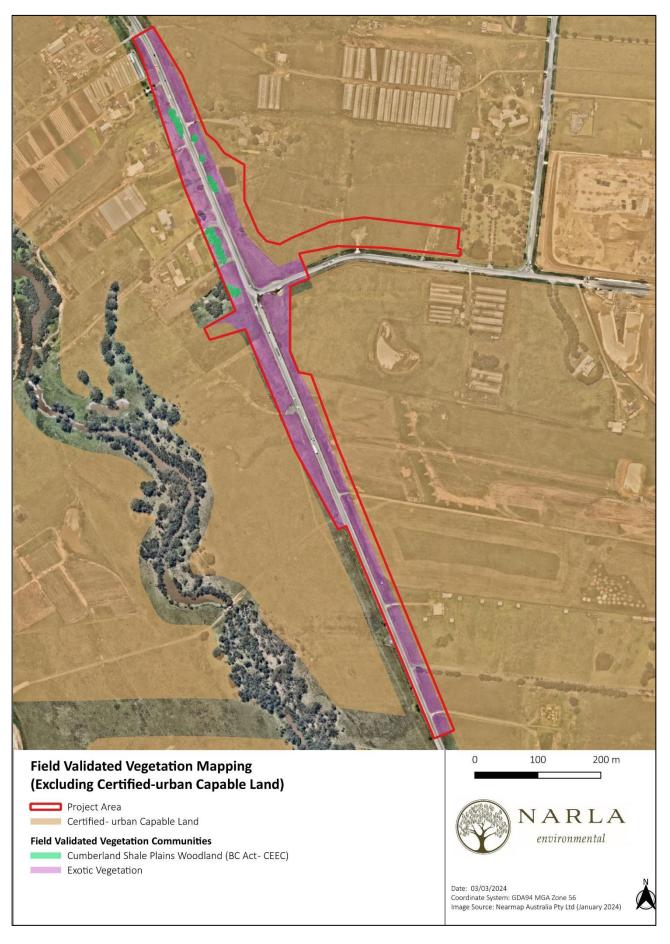

Figure 5. Narla Field-validated Vegetation Mapping within the Project Area.

Table 4. Cumberland Shale Plains Woodland identified within the Project Area.

#### **Cumberland Shale Plains Woodland**

Extent within the Project Area (approx.; excluding areas mapped as Certified-urban 0.23ha Capable Land)

#### Description (DPE 2022)

A tall to very tall sclerophyll woodland to open forest with a mid-stratum of soft-leaved shrubs and small trees with a grassy ground cover that is extensive on rises and upper slopes of hills south from Cecil Hills, in the south-western part of the Cumberland Plain to the west of Sydney. It is most extensive in Campbelltown, Camden and Wollondilly local government areas. The canopy commonly includes *Eucalyptus moluccana* and *Eucalyptus tereticornis*, with a sparse shrub to small tree layer which very frequently includes *Bursaria spinosa* and at least one species of Acacia, of which *Acacia implexa* is most frequent. The presence of *Acacia implexa* helps distinguish this PCT from PCT 3320, which has a similar assemblage and structure. The mid-dense ground layer typically includes forbs, grasses and twiners. *Dichondra repens* is almost always present and *Microlaena stipoides*, *Desmodium varians*, *Brunoniella australis* and *Aristida ramosa* are very frequent. This PCT typically

#### **Cumberland Shale Plains Woodland**

occurs in a warm, moist climate between 90-300 metres asl. It has been heavily cleared and now occurs in small remnants with varying levels of disturbance within a rural landscape. The canopy in these remnants often comprises immature cohorts of trees that have regenerated after thinning or clearing.

### Description of the Vegetation in the Project Area.

The vegetation within this zone consited of native canopy species such as *Eucalyptus tereticornis* and *Eucalyptus molucanna* above a highly disturbed understory dominated by exotic grasses such as *Cenchrus clandestinus, Paspalum dilatatum* and *Chloris gayana*.

Justification of Vegetation Assignment	The determination of this community was based on the geographical region, landscape attributes including soil landscapes and elevation, and the presence of diagnostic species.
BC Act 2016 Status	This vegetation within the Project Area conforms to the BC Act listed Cumberland Plain Woodland in the Sydney Basin Bioregion Critically Endangered Ecological Community (CEEC) (see <b>section 4.1.1</b> ).
EPBC Act 1999 Status	Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest is associated with this vegetation type. This vegetation within the Project Area however, failed to meet the condition thresholds for the community and therefore <b>DOES NOT</b> conform to the CEEC listed under the EPBC Act (see <b>section 4.1.2</b> ).
References	Department of Planning and Environment (DPE) (2022) State Vegetation Type Mapping

Table 5. Exotic Vegetation identified within the Project Area.

#### **Exotic Vegetation**

Extent within the Project Area (approx.; excluding areas mapped as Certified-urban 4.29ha Capable Land)

### Description of the Vegetation in the Project Area

This zone contains primarily exotic vegetation. This exotic vegetation came in form of primarily an exotic-dominated grassland. This zone had an almost absent canopy layer, except for sporadic roadside trees. The shrub layer was sparse however included the Priority Weed, *Rubus fruticosus species aggregate*. The groundlayer was almost entirely comprised of exotic species. The Priority Weeds, *Senecio madagascariensis* was sighted within this layer. Environmental weeds in the groundlayer included *Paspalum diltatum, Rumex obtusifolia, Conyza bonariensis, Cenchrus clandestinus, Chloris guyana, Bromus catharticus, Verbena bonariensis, Avena barbata, Sida rhombifolia, Solanum linnaeanum, Solanum nigrim, Bouteloua dactyloides, <i>Trifolium repens, Araujia sericifera, Modiola caroliniana, Cirsium vulgare, Setaria parviflora, Hypochaeris radicata* and *Centaurium erythraea*. *Native groundcovers were sparse however inclided Persicaria decipiens, Cynodon dactylon* and *Eragrostis brownii*.

Justification of Vegetation Assignment	The vegetation within this area consisted of exotic vegetation with minimal native species. As the vegetation could not be classified as a native community it has been classified as Exotic Vegetation.
BC Act 2016 Status	N/A
EPBC Act 1999 Status	N/A

# 4. Threatened Entities

## 4.1 Threatened Ecological Communities (TECs)

4.1.1 Listing under the BC Act: Cumberland Plain Woodland in the Sydney Basin Bioregion – Critically Endangered Ecological Community (CEEC)

The vegetation mapped within the Project Area as Cumberland Shale Plains Woodland conforms to the BC Act listed CEEC, Cumberland Plain Woodland in the Sydney Basin Bioregion as it contains species indicative of this CEEC and occurs within the associated geology and landscape position.

Cumberland Plain Woodland is the name given to the ecological community in the Sydney Basin bioregion associated with clay soils derived from Wianamatta Group geology, or more rarely alluvial substrates, on the Cumberland Plain, a rainshadow area to the west of Sydney's Central Business District. The community typically occurs on flat to undulating or hilly terrain up to about 350 m elevation but may also occur on locally steep sites and at slightly higher elevations. Cumberland Plain Woodland typically comprises an open tree canopy, a near-continuous groundcover dominated by grasses and herbs, sometimes with layers of shrubs and/or small trees. Shrubs may sometimes occur in locally dense stands. Less disturbed stands of the community may have a woodland or forest structure. Small trees or saplings may dominate the community in relatively high densities after partial or total clearing, and the groundcover may be relatively sparse, especially where densities of trees or shrubs are high (NSW Scientific Committee 2011).

Native species listed within the final determination (NSW Scientific Committee 2011) that occur within the Project Area include:

- Corymbia maculata;
- Eucalyptus moluccana; and
- Eucalyptus tereticornis.

Approximately 0.23ha of land mapped as Cumberland Plain Woodland is located in land identified as "Excluded Land" or "Avoided Land" under the CPCP. This vegetation will be subject to further assessment under the BC Act (Appendix D).

#### 4.1.2 Listing under EPBC Act -- Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest

In order to be protected as a matter of national environmental significance areas of the ecological community must meet both:

- The key diagnostic characteristics (Table 6); and
- At least the minimum condition thresholds (Section 5.2.1).

The vegetation mapped within the Project Area as Cumberland Shale Plains Woodland does not meet the Key Diagnostic Features for the community (**Table 6**), nor does it meet the key condition thresholds required to meet the EPBC Act listing status (**Table 7**). Therefore, areas mapped as Cumberland Shale Plains Woodland within the Project Area do not conform to the EPBC Act listed Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest (Threatened Species Scientific Committee 2009) and no further assessment under the EPBC Act is required for this vegetation in the Project Area.

Table 6. Key diagnostics features required to meet the EPBC Listing Status for Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest (Threatened Species Scientific Committee 2009).

	Status in the Project Area
Thresholds	Cumberland Shale Plains Woodland (Canopy)
Distribution is limited to the Sydney Basin Bioregion with most occurrences in the Cumberland Sub-region. This covers a geographic area commonly known as the Cumberland Plain, a rainshadow coastal valley in western Sydney.	Yes
Most occurrences are on clay soils derived from Wianamatta Group geology, with limited to rare occurrences on soils derived from Tertiary Alluvium, Holocene Alluvium, the Mittagong Formation, Aeolian Deposits and Hawkesbury Sandstone.	Yes
<ul> <li>Upper tree layer species must be present with these features:         <ul> <li>The minimum projected foliage cover of canopy trees is 10% or more; and</li> <li>The tree canopy is typically dominated by <i>Eucalyptus moluccana</i> (Grey Box), <i>E. tereticornis</i> (Forest Red Gum) and/or <i>E. fibrosa</i> (Red Ironbark).</li> </ul> </li> <li>Other canopy species may occur in association with the typical dominants and may be locally dominant at some sites.</li> </ul>	Yes
A sparse lower tree layer may be present, typically with young eucalypts of upper tree canopy species and species of Acacia, Exocarpos and Melaleuca.	Yes
<ul> <li>The understorey typically is dominated by the ground layer and shows these features:</li> <li>The ground layer typically comprises a variety of perennial native graminoids and forbs;</li> <li>Native graminoid species that are often present include: the grasses Aristida ramosa (Purple Wiregrass), A. vagans (Threeawn Speargrass), Cymbopogon refractus (Barbed Wire Grass), Dichelachne micrantha (Plumegrass), Echinopogon caespitosus var. caespitosus (Tufted Hedgehog Grass), Eragrostis leptostachya (Paddock Lovegrass), Microlaena stipoides subsp. stipoides (Weeping Grass), Paspalidium distans and Themeda triandra (Kangaroo Grass), and other graminoids Carex inversa (Knob Sedge), Cyperus gracilis (Slender Sedge), Lomandra filiformis subsp. filiformis (Wattle Mat-rush) and L. multiflora subsp. multiflora (Many flowered Mat-rush);</li> <li>Native forb and other herb species present include: Asperula conferta (Common Woodruff), Brunoniella australis (Blue Trumpet), Cheilanthes sieberi (Poison Rock-Fern), Desmodium varians (Slender Tick-trefoil), Dianella longifolia (Blue Flax-Lily), Dichondra repens (Kidney Weed), Glycine spp., Hardenbergia violacea (Native Sarsparilla), Opercularia diphylla (Stinkweed), Oxalis perennans, Pratia purpurascens (Whiteroot) and Wahlenbergia gracilis (Australian Bluebell); and</li> <li>A shrub layer may be present, to variable extent, and is often dominated by Bursaria spinosa (Blackthorn) while other species include: Daviesia ulicifolia (Gorse Bitter Pea), Dillwynia sieberi, Dodonaea viscosa subsp. cuneata (Wedge-leaf Hop-bush), Indigofera australis (Native Indigo) and Lissanthe strigosa (Peach Heath).</li> </ul>	No

Table 7. Condition classes and thresholds for Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest (Threatened Species Scientific Committee 2009).

Category and Rationale	Thresholds	Thresholds Present within the Project Area	
A. Core thresholds that apply under most circumstances: patches with an understorey dominated by natives and a minimum size that is functional and consistent within mapping unit size applied in NSW.	Minimum patch size is >0.5ha.  AND  >50% of the perennial  understorey vegetation cover is  made up of native species.	No. The patch size is <0.5ha and <50% of the perennial understorey vegetation cover is made up of native species.	
	OR		
B. Larger patches which are inherently variable due to their rarity.	The patch size is >5ha;  AND  >30% of the perennial  understorey vegetation cover is  made up of native species.	No. The patch size is <5ha and <30% of the perennial understorey vegetation cover is made up of native species.	
	OR		
C. Patches with connectivity to large native vegetation remnants in the landscape.	The path size is >0.5ha;  AND  ≥30% of the perennial  understorey vegetation cover is  made up of native species;  AND  The patch is contiguous with a  native vegetation remnant (any  native vegetation where cover in  each layer present is dominated  by native species) that is ≥5ha in  area.	No. The patch size is <0.5ha and <30% of the perennial understorey vegetation cover is made up of native species and the patch is not contiguous with another native vegetation remnant that is ≥5ha.	
	OR		
D. Patches that have large mature trees or trees with hollows (habitat) that are very scarce on the Cumberland Plain.	The patch size is >0.5ha in size;  AND  ≥30% of the perennial  understorey vegetation cover is  made up of native species;  AND  The patch has at least one tree  with hollows per hectare or at  least one large tree (≥80 cm dbh)  per hectare from the upper tree  layer species outlined in the  Description and Appendix A.	No. The patch size is <0.5ha and <30% of the perennial understorey vegetation cover is made up of native species and the patch does not have at least one tree with hollows per hectare or at least one large tree >80cm dbh per hectare.	
thresholds for Cumberland Plain Sha	nd within the Project Area <b>DOES NO</b> ale Woodlands and Shale-Gravel Trar to be part of the CEEC under the EPE	nsition Forest; therefore, it is <b>NOT</b>	

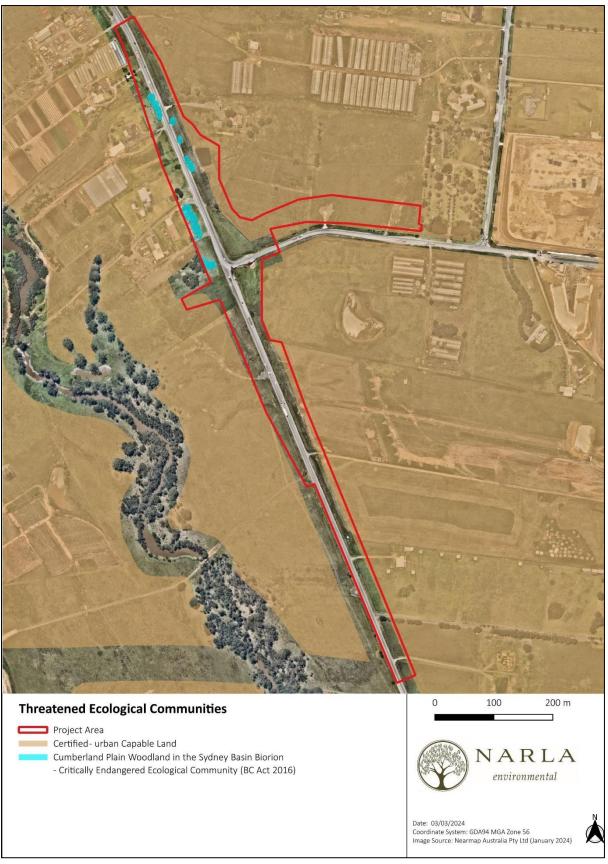

Figure 6. Threatened Ecological Communities within the Project Area (BC 2016).

## 4.2 Threatened Flora

Desktop analysis revealed several threatened flora species as occurring within a 10km x 10km cell centred on the Project Area. These species were assessed for their potential to occur within the Project Area (**Table 8**). The survey effort for this assessment is presented in **Figure 7**.

Table 8. Likelihood of occurrence of threatened flora species within the Project Area (V=Vulnerable; E=Endangered; CE=Critically Endangered)

Species	BC Act	EPBC Act	Likelihood of occurrence within the Project Area	Further Impact Assessment Required?
Acacia pubescens (Downy Wattle)	V	V	Absent. Occurs on alluviums, shales and at the intergrade between shales and sandstones. The soils are characteristically gravely soils, often with ironstone. Occurs in open woodland and forest, in a variety of plant communities, including Cooks River/Castlereagh Ironbark Forest, Shale/Gravel Transition Forest and Cumberland Plain Woodland. Potential habitat is present within the Project Area. A targeted survey was undertaken during the approved DPE survey period (all year round), and no individuals were identified.	No
Dillwynia tenuifolia	V	-	Low. In western Sydney, may be locally abundant particularly within scrubby/dry heath areas within Castlereagh Ironbark Forest and Shale Gravel Transition Forest on tertiary alluvium or laterised clays. May also be common in transitional areas where these communities adjoin Castlereagh Scribbly Gum Woodland. Potential habitat is present, however due to the degraded nature of the Project Area, it is unlikely for this species to occur. Although a targeted survey was undertaken outside the approved DPE survey period (August-October), no <i>Dillwynia spp.</i> individuals were identified.	No
Grevillea juniperina subsp. juniperina (Juniper- leaved Grevillea)	V	-	Absent. Grows on reddish clay to sandy soils derived from Wianamatta Shale and Tertiary alluvium (often with shale influence), typically containing lateritic gravels. Recorded from Cumberland Plain Woodland, Castlereagh Ironbark Woodland, Castlereagh Scribbly Gum Woodland and Shale/Gravel Transition Forest. Potential habitat is present within the Project Area. A targeted survey was undertaken during the approved DPE survey period (all year round), and no individuals were identified.	No
Grevillea parviflora subsp. parviflora (Small- flower Grevillea)	V	V	Low. Grows in sandy or light clay soils usually over thin shales, often with lateritic ironstone gravels and nodules. Sydney region occurrences are usually on Tertiary sands and alluvium, and soils derived from the Mittagong Formation. Soil landscapes include Lucas Heights or Berkshire Park. Potential habitat is present, however due to the degraded nature of the Project Area, it is unlikely for this species to occur.	No
Isotoma fluviatilis subsp. fluviatilis	-	Ex	Low. This species is thought to be extinct. Known to grow in damp places, on the Cumberland Plain, including freshwater wetland, grassland/alluvial woodland and an alluvial woodland/shale plains woodland (Cumberland Plain Woodland) ecotone. Potential habitat is present, however due to the degraded nature of the	No

Species	BC Act	EPBC Act	Likelihood of occurrence within the Project Area	Further Impact Assessment Required?
			Project Area, it is unlikely for this species to occur. Although a targeted survey was undertaken outside the approved DPE survey period (September-November), no <i>Isotoma spp</i> . individuals were identified.	
Marsdenia viridiflora subsp. viridiflora (Native Pear)	E	-	Absent. This species grows in vine thickets and open shale woodland. Potential habitat is present within the Project Area. A targeted survey was undertaken during the approved DPE survey period (November-February), and no individuals were identified.	No
Persoonia nutans (Nodding Geebung)	E	E	Absent. Northern populations are confined to aeolian and alluvial sediments and occur in a range of sclerophyll forest and woodland vegetation communities, with the majority of individuals occurring within Agnes Banks Woodland or Castlereagh Scribbly Gum Woodland and some in Cooks River / Castlereagh Ironbark Forests. Southern populations also occupy tertiary alluvium, but extend onto shale sandstone transition communities and into Cooks River / Castlereagh Ironbark Forest. Potential habitat is not present within the Project Area. However, a targeted survey was undertaken during the approved DPE survey period (all year round), and no individuals were identified.	No
Pultenaea pedunculata (Matted Bush-pea)	E	-	Low. In the Liverpool - Fairfield area, the majority of occurrences are in lower-lying areas and often close to creek lines. Soils are moderately to poorly drained. Potential habitat is present, however due to the degraded nature of the Project Area, it is unlikely for this species to occur. Although a targeted survey was undertaken outside the approved DPE survey period (September-November), no <i>Pultenaea spp</i> . individuals were identified.	No
Pimelea spicata (Spiked Rice-flower)	Е	Е	Absent. This species is found on well-structured clay soils. On the Cumberland Plain sites, it is associated with Grey Box communities (particularly Cumberland Plain Woodland variants and Moist Shale Woodland) and in areas of ironbark. Potential habitat is present within the Project Area. A targeted survey was undertaken during the approved DPE survey period (all year round), and no individuals were identified.	No

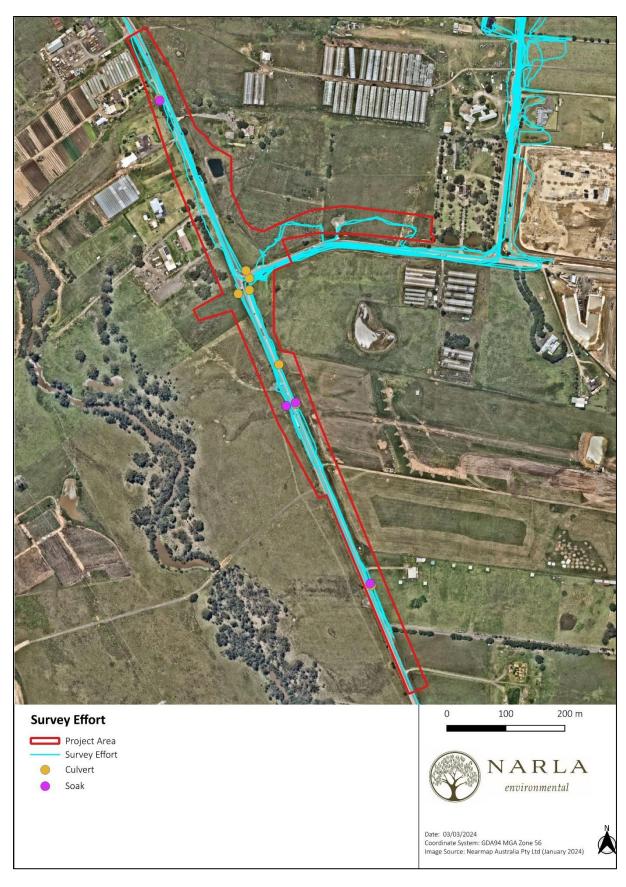

Figure 7. Threatened Species Survey effort and Habitat Features identified with the Project Area.

#### 4.3 Threatened Fauna

Several habitat features were present within the Project Area (**Table 9**). Desktop analysis revealed that several threatened fauna species have the potential to utilise such habitat within the Project Area during part of their lifecycles (**Table 10**). No threatened fauna species were observed within the Project Area by the Narla Ecologists during their site assessment in February and March 2023 or March 2024.

It is unlikely that the proposed works will have a significant impact such that a local viable population or occurrence of any of the threatened fauna species will be placed at risk of extinction (**Table 10**). Therefore, no BDAR or EPBC Act Referral to Commonwealth is required for the proposed activity. Any areas of fauna habitat nominated as 'Certified-urban capable land' under the Cumberland Plain Conservation Plan (CPCP) require no further assessment under the BC Act.

Table 9. Fauna habitat values within the Project Area.

Habitat component	Site values
Coarse woody debris	Absent.
Rock outcrops and bush rock	Absent.
Caves, crevices, and overhangs	Absent.
Culverts, bridges, mine shafts, or abandoned structures	Numerous culverts were identified within the Project Area ( <b>Figure 7</b> ). These culverts were inspected utilising a torch from the entrances and no fauna were found to be inhabiting them at the time of the site assessments.
Nectar/lerp-bearing Trees	Present. The Project Area and surrounds contained sporadic <i>Eucalypt spp</i> . and <i>Corymbia spp</i> Such trees and shrubs may provide intermittent nectar and/or lerp sources for a suite of species.
Nectar-bearing shrubs	Absent
Koala Feed Trees	Present.
Large stick nests	Absent.
Sap and gum sources	Present. Select Eucalypts were present within the Project Area.
She-oak fruit (Glossy Black Cockatoo feed)	Absent
Seed-bearing trees and shrubs	Present. Select Eucalypts were present within the Project Area.
Soft-fruit-bearing trees	Absent.
Dense shrubbery and leaf litter	Absent
Tree hollows	Absent.
Decorticating bark	Absent.
Wetlands, soaks, and streams	Present. Soaks were sporadically present within the Project Area. One (1) $2^{nd}$ order stream was present within the Project Area.
Open water bodies	Present. A small dam was located within the Project Area however was located within land mapped as 'Certified-urban Capable Land' .
Estuarine, beach, mudflats, and rocky foreshores	Absent.

#### 4.3.1 Migratory Fauna Species

Desktop analysis revealed following EPBC Act listed migratory terrestrial fauna species were considered to have the potential to utilise habitat within the Project Area (e.g., foraging or passage) during part of their lifecycles:

- Cuculus optatus (Oriental Cuckoo);
- Hirundapus caudacutus (White-throated Needletail);
- Hydroprogne caspia (Caspian Tern);
- Monarcha melanopsis (Black-faced Monarch);
- Motacilla flava (Yellow Wagtail);
- Myiagra cyanoleuca (Satin Flycatcher); and
- Rhipidura rufifrons (Rufous Fantail).

The proposed activity will have negligible impacts to potential foraging and breeding habitat for these species given their migratory nature. In the unlikely event that these species forage within the Project Area, the proposed removal of vegetation will have minimal impacts to foraging habitat given the large areas of better suited habitat in the surrounding area and in their migratory range. As such, the proposed activity will have no significant impact on these species; therefore, a Referral to Commonwealth pursuant to the EPBC Act is not required.

Table 10. List of potential threatened fauna that may occupy the Project Area at some stage of their lifecycles. Vulnerable = V, Endangered = E, Endangered Population = EP, Critically Endangered = CE.

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impac Assessment Required?
<i>Anthochaera</i> <i>phrygia</i> (Regent Honeyeater)	Е	CE	Low	A generalist forager, although it feeds on the nectar from a small number of eucalypts that produce high volumes of nectar. Eucalyptus feed trees have been identified within the Project Area.	This species breeds in temperate woodlands and riparian gallery forests in only three known locations: north-east Victoria (Chiltern-Albury), and in NSW at Capertee Valley and the Bundarra Barraba region. The Project Area is not mapped on the Regent Honeyeater Important Areas Map (DPE 2024b).	Minimal impact to foraging habitat given the mobility of the species and degraded state of the Project Area. No impact to breeding habitat.	No
Artamus cyanopterus cyanopterus (Dusky Woodswallow)	V	_	Low	Primarily inhabit dry, open eucalypt forests and woodlands, including mallee associations, with an open or sparse understorey of eucalypt saplings, acacias and other shrubs, and groundcover of grasses or sedges and fallen woody debris. It has also been recorded in shrublands, heathlands and very occasionally in moist forest or rainforest.  Primarily eats invertebrates, insects, which are captured whilst hovering or sallying above the canopy or over water. Also occasionally take nectar, fruit, and seed. Potential foraging	Nest sites vary, but occur in shrubs or low trees, living or dead, horizontal, or upright forks in branches, spouts, hollow stumps, or logs, behind loose bark or in a hollow in the top of a wooden fence post. Nest sites may be exposed or well concealed by foliage. No nests were present within the Project Area.	Minimal impact to foraging habitat given the mobility of the species and the degraded state of the Project Area. No impact to breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
				habitat is present within the Project Area.			
Daphoenositta chrysoptera (Varied Sittella)	V	-	Low	Feeds on arthropods gleaned from crevices in rough or decorticating bark, dead branches, standing dead trees and small branches and twigs in the tree canopy. Potential foraging habitat was present within the Project Area.	Builds a cup-shaped nest of plant fibres and cobwebs in an upright tree fork high in the living tree canopy, and often re-uses the same fork or tree in successive years. No nests were present within the Project Area.	Minimal impact to potential foraging habitat given mobility of the species and the degraded state of the Project Area. No anticipated net loss of breeding habitat.	No
Falsistrellus tasmaniensis (Eastern False Pipistrelle)	V	-	Low	Hunts beetles, moths, weevils, and other flying insects above or just below the tree canopy. Potential foraging habitat was present within the Project Area.	Roosts in eucalypt hollows, but has also been found under loose bark on trees or in buildings. No potential breeding habitat was present within the Project Area.	Minimal impact to potential foraging habitat given mobility of the species and the degraded state of the Project Area. No anticipated net loss of breeding habitat.	No.
Glossopsitta pusilla (Little Lorikeet)	V	_	Low	This species forages primarily in the canopy of open Eucalypt forests and woodlands. Riparian habitats are particularly used, due to higher soil fertility and hence greater productivity. Potential foraging habitat is present within the Project Area.	Nests in proximity to feeding areas, if possible, most typically selecting hollows in the limb or trunk of smooth-barked Eucalypts. Entrance is small (3 cm) and high above the ground (2–15 m). No hollows were identified within the Project Area.	Minimal impact to potential foraging habitat given mobility of the species and the degraded state of the Project Area. No anticipated net loss of breeding habitat.	No.
Haliaeetus leucogaster (White-bellied Sea- Eagle)	V	-	Low	Habitats are characterised by the presence of large areas of open water including larger rivers, swamps, lakes, and the sea.	Breeding habitat consists of mature tall open forest, open forest, tall woodland, and swamp sclerophyll forest close to	Negligible, no anticipated net loss of foraging or breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
				Occurs at sites near the sea or sea-shore, such as around bays and inlets, beaches, reefs, lagoons, estuaries, and mangroves; and at, or in the vicinity of freshwater swamps, lakes, reservoirs, billabongs, and saltmarsh. No such habitat was identified within the Project Area as not large waterbodies were present.	foraging habitat. Nests are large structures built from sticks and lined with leaves or grass. No nests were identified within the Project Area.		
Hieraaetus morphnoides (Little Eagle)	V	-	Low	Occupies open eucalypt forest, woodland, or open woodland. She-oak or Acacia woodlands and riparian woodlands of interior NSW are also used. Preys on birds, reptiles, and mammals, occasionally adding large insects and carrion. Potential prey items may occur within the Project Area.	Nests in tall living trees within a remnant patch, where pairs build a large stick nest in winter. No nests were identified within the Project Area.	Negligible, no anticipated net loss of foraging or breeding habitat.	No
Ixobrychus flavicollis (Black Bittern)	V	-	Low	Inhabits both terrestrial and estuarine wetlands, generally in areas of permanent water and dense vegetation. Where permanent water is present, the species may occur in flooded grassland, forest, woodland, rainforest and mangroves. Potential foraging habitat is present within the Project Area.	Like other bitterns, but unlike most herons, nesting is solitary.  Nests, built in spring are located on a branch overhanging water and consist of a bed of sticks and reeds on a base of larger sticks.  Between three and five eggs are laid and both parents incubate and rear the young. No nests or potential habitat were present within the Project Area.	Minimal impact to potential foraging habitat given mobility of the species and the degraded state of the Project Area. No anticipated net loss of breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Lathamus discolor (Swift Parrot)	Е	CE	Low	On the mainland they occur in areas where eucalypts are flowering profusely or where there are abundant lerp (from sap-sucking bugs) infestations. Potential foraging habitat present within the Project Area with the presence of <i>Eucalyptus</i> species. However, Project Area is not mapped on the Swift Parrot Important Areas Map (DPE 2024b).	N/A. Breeds in Tasmania.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Litoria aurea (Green and Golden Bell Frog)	E	V	Low	Inhabits marshes, dams and stream-sides, particularly those containing bullrushes ( <i>Typha spp.</i> ) or spikerushes ( <i>Eleocharis spp.</i> ). Potential foraging habitat is present within the Project Area.	Optimum habitat includes water-bodies that are unshaded, free of predatory fish such as Plague Minnow ( <i>Gambusia holbrooki</i> ), have a grassy area nearby and diurnal sheltering sites available. Males call while floating in water and females produce a raft of eggs that initially float before settling to the bottom, often amongst vegetation. Potential breeding habitat is present in the form of a dam and soaks.	Minimal impact to potential foraging and breeding habitat given the degraded nature of the Project Area and small size of the dam and temporary nature of the soaks.	Yes. A BC Act Test of Significance (Appendix E) and EPBC Act test of significance was undertaken for this species (Appendix F). As the dam is located in Certified – urban capable land, no further assessment is required under the BC Act for this feature.

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Lophoictinia isura (Square-tailed Kite)	V	-	Low	Found in a variety of timbered habitats including dry woodlands and open forests. Shows a particular preference for timbered watercourses. Potential foraging habitat is present within the Project Area.	Breeding is from July to February, with nest sites generally located along or near watercourses, in a fork or on large horizontal limbs.  No nests were identified within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Meridolum corneovirens (Cumberland Plain Land Snail)	E	-	Low	This species primarily inhabits Cumberland Plain Woodland west of Sydney. It lives under litter of bark, leaves and logs, or shelters in loose soil around grass clumps. Occasionally shelters under rubbish. Potential foraging habitat is present within the Project Area.	Little is known of its biology, including breeding biology. It is known to be hermaphroditic, laying clutches of 20-25 small, round, white eggs in moist, dark areas (such as under logs).  Potential breeding habitat is present within the Project Area.	Minimal impact to potential foraging and breeding habitat given the degraded nature of the Project Area. A targeted search for this species was undertaken within areas of potential habitat and no individuals were observed.	No
Micronomus norfolkensis (Eastern Coastal Free-tailed Bat)	V	-	Low	Occur in dry sclerophyll forest, woodland, swamp forests and mangrove forests east of the Great Dividing Range, feeding on insects. Potential foraging habitat is present within the Project Area.	Roost in tree hollows but will also roost under bark or in manufactured structures. Culverts were located within the Project Area that has the potential to provide habitat for this species, however inspections were undertaken and no individuals were located.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Miniopterus australis (Little Bent-winged Bat)	V	_	Low	Found in moist eucalypt forest, rainforest, vine thicket, wet and dry sclerophyll forest, Melaleuca swamps, dense coastal forests, and banksia scrub. Generally found in well-timbered areas. at night forage for small insects beneath the canopy of densely vegetated habitats. Potential foraging habitat is present within the Project Area.	This species only breeds in caves. Culverts were located within the Project Area that has the potential to provide habitat for this species, however inspections were undertaken and no individuals were located.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Miniopterus orianae oceanensis (Large Bent-winged Bat)	V	-	Low	Hunt in forested areas, catching moths and other flying insects above the tree tops. Potential foraging habitat present within the Project Area.	This species only breeds in caves. Culverts were located within the Project Area that has the potential to provide habitat for this species, however inspections were undertaken and no individuals were located.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Myotis macropus (Southern Myotis)	V	-	Low	This species forages over streams and pools catching insects and small fish by raking their feet across the water surface. Potential foraging habitat present within the Project Area.	Roost in groups of 10 - 15 close to water in caves, mine shafts, hollow-bearing trees, storm water channels, buildings, under bridges and in dense foliage. Culverts were located within the Project Area that has the potential to provide habitat for this species, however inspections were undertaken and no individuals were located.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Ninox strenua (Powerful Owl)	V	-	Low	Inhabits a range of vegetation types, from woodland and open sclerophyll forest to tall open wet forest and rainforest. The main prey items are medium-sized arboreal marsupials, particularly the Greater Glider, Common Ringtail Possum and Sugar Glider. As most prey species require hollows and a shrub layer, these are important habitat components for the owl. Potential prey items may occur within the Project Area.	Powerful Owls nest in large tree hollows (at least 0.5m deep), in large eucalypts (diameter at breast height of 80-240cm) that are at least 150 years old. No hollows were present within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Pteropus poliocephalus (Grey- headed Flying-fox)	V	V	Low	Occur in subtropical and temperate rainforests, tall sclerophyll forests and woodlands, heaths, and swamps as well as urban gardens and cultivated fruit crops. Feed on the nectar and pollen of native trees, in particular Eucalyptus, Melaleuca and Banksia, and fruits of rainforest trees and vines. Potential foraging tree species present within the Project Area.	No breeding camps were found within or surrounding the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Rostratula australis (Australian Painted Snipe)	Е	E	Low	Prefers fringes of swamps, dams and nearby marshy areas where there is a cover of grasses, lignum, low scrub or open timber. Potential foraging habitat is present within the Project Area.	The nest consists of a scrape in the ground, lined with grasses and leaves. No nests were sighted within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Saccolaimus flaviventris (Yellow- bellied Sheathtail- bat)	V	-	Low	When foraging for insects, flies high and fast over the forest canopy, but lower in more open country. Forages in most habitats across its very wide range, with and without trees. Potential foraging habitat present within the Project Area.	This species requires tree hollows for breeding/roosting. No potential breeding habitat is present within Project Area.	net loss of breeding habitat.  Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Scoteanax rueppellii (Greater Broad- nosed Bat)	V	-	Low	Forages after sunset, flying slowly and directly along creek and river corridors. Potential foraging is present within the Project Area.	This species requires tree hollows for breeding/roosting. No potential breeding habitat is present within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No
Stagonopleura guttata (Diamond Firetail)	V	-	Low	Found in grassy eucalypt woodlands, including Box-Gum Woodlands and Snow Gum Eucalyptus pauciflora Woodlands. Also occurs in open forest, mallee, Natural Temperate Grassland, and in secondary grassland derived from other communities. Potential foraging habitat is present within the Project Area.	Nests are globular structures built either in the shrubby understorey, or higher up, especially under hawk's or raven's nests.  Birds roost in dense shrubs or in smaller nests built especially for roosting. No nests were identified within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No

Species	BC Act	EPBC Act	Likelihood of Occurrence	Foraging Habitat Present Within the Project Area	Breeding Habitat Present Within the Project Area	Anticipated Impact	Further Impact Assessment Required?
Stictonetta naevosa (Freckled Duck)	V	-	Low	Prefer permanent freshwater swamps and creeks with heavy growth of Cumbungi, Lignum or Tea-tree. During drier times they move from ephemeral breeding swamps to more permanent waters such as lakes, reservoirs, farm dams and sewage ponds.  Potential foraging habitat is present within the Project Area.	Nests are usually located in dense vegetation at or near water level. No nests were located within the Project Area.	Minimal impact to potential foraging habitat given the mobility of the species and the degraded nature of the Project Area. No anticipated net loss of breeding habitat.	No

## 5. Impact Summary

### 5.1 Vegetation Loss

The following vegetation (located outside of Certified-urban Capable Land) within the Project Area will be impacted by the proposed activity:

- 0.23ha of Cumberland Shale Plains Woodland.
  - o conforms to the BC Act listed Cumberland Plain Woodland in the Sydney Basin Bioregion (CEEC); and
- 4.29ha of Exotic Vegetation.

### 5.2 Threatened Ecological Communities

#### 5.2.1 Local Occurrence of Cumberland Plain Woodland in the Sydney Basin Bioregion

Local occurrence is defined as the ecological community that occurs within the study area (OEH 2018). However, the local occurrence may include adjacent areas if the ecological community on the study area forms part of a larger contiguous area of that ecological community and the movement of individuals and exchange of genetic material across the boundary of the study area can be clearly demonstrated (OEH 2018).

State Vegetation Type Mapping (DPE 2022) and aerial vegetation mapping identified areas of Cumberland Plain Woodland in the Sydney Basin Bioregion (Cumberland Shale Plains Woodland). These areas, in addition to the Narla field-validated vegetation mapped within the Project Area, form part of the local occurrence of this CEEC within the locality (Figure 8). No areas of Cumberland Shale Plains Woodland mapped as occurring within 'Certified Land' was included in local occurrence calculations.

It was calculated that the local occurrence of Cumberland Plain Woodland (located outside of Certified Land) for the Project Area was approximately 86.20ha. The removal of 0.23ha of non-certified Cumberland Plain Woodland within the Project Area constitutes approximately 0.26% of the local occurrence of this CEEC (BC Act).

A Test of Significance (5-part test) in accordance with Section 7.3 of the BC Act, was conducted to assess potential impacts from the proposed activity on Cumberland Plain Woodland (Appendix D).

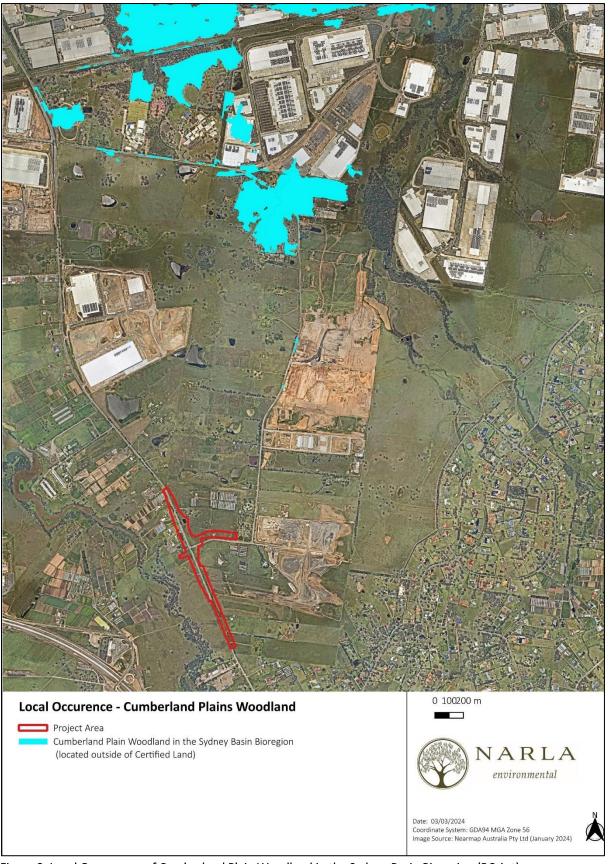

Figure 8. Local Occurrence of Cumberland Plain Woodland in the Sydney Basin Bioregion (BC Act).

## 6. Recommendations

This section of the report details recommended efforts to avoid and minimise impact on biodiversity values associated with the proposed activity. Measures to be implemented before, during and post construction to avoid and minimise the impacts of the project are detailed in **Table 11**.

Table 11. Table of measures to be implemented before, during and after construction to avoid and minimise the impacts of the project.

Action	Outcome	Timing	Responsibility
Project Location, Design and Planning	Due to the nature of the proposed activity, all vegetation within the Project Area will be impacted. Owing to the need to facilitate road upgrades for the changing needs of the locality no alternate locations were possible for the proposed works.	Pre- construction phase	Proponent
Assigning a Project Ecologist	Prior to the implementation of the activity, the proponent should commission the services of a qualified and experienced Ecologist with a minimum tertiary degree in Science, Conservation, Biology, Ecology, Natural Resource Management, Environmental Science or Environmental Management. The Ecologist must be licensed with a current Department of Primary Industries Animal Research Authority permit and New South Wales Scientific License issued under the BC Act.  The Ecologist will be commissioned to:  • Undertake any required targeted searches for threatened flora prior to vegetation clearing;  • Undertake an extensive pre-clearing survey which includes targeted searches for threatened fauna threatened flora and Priority Weeds, and delineating habitat-bearing trees and shrubs;  • Undertake an additional targeted surveys for the threatened Cumberland Land Snail;  • Undertake an extensive pre-clearing survey which includes targeted searches for threatened fauna (including potential <i>Litoria aurea</i> [Green and Golden Bell Frog] within soaks prior to removal);  • Undertake an additional pre-clearing survey of culverts to be removed in case on inhabitation by microbat species; and  • Supervise the clearing/modification of any aquatic habitat including creeks or dams in order to capture, treat and/or relocate any displaced fauna.	Pre- construction phase	Proponent
Tree Protections	Australian Standard 4970 (2009) Protection of Trees on Development Sites (AS-4970) outlines that a Tree Protection Zone (TPZ) is the principal means of protecting trees on construction sites. It is an area isolated from construction disturbance so that the tree remains viable. Ideally, works should be avoided within the TPZ.	Pre- construction phase	Proponent Arborist
	A Minor Encroachment is less than 10% of the TPZ and is outside the structural root zone (SRZ). A Minor Encroachment is considered acceptable by AS-4970 when it is compensated for elsewhere and contiguous within the TPZ. A Major Encroachment is greater than 10% of the TPZ or inside the SRZ. Major Encroachments	•	

Action	Outcome	Timing	Responsibility
	require root investigations undertaken by non-destructive methods or the use of tree sensitive construction methods.		
	Tree protection fencing is to be installed around all trees proposed for retention in the immediate vicinity of the proposed works.		
Erection of temporary fencing	Temporary barriers (e.g., flagging tape) should be erected around retained native vegetation that may incur indirect impacts on biodiversity values due to the construction works.	Pre- construction phase	Proponent Construction Contractor
Erosion and Sedimentation	Appropriate erosion and sediment control must be erected and always maintained during construction to avoid the potential of incurring indirect impacts on biodiversity values. An Erosion and Sediment Control Plan should be developed to the Soils and Construction Managing Urban Stormwater Standards (Landcom 2004).	Construction phase	Proponent  Construction  Contractor
Vegetation Replacement	Any roadside revegetation/landscape works should utilise tree species representative of the Cumberland Plain Woodland community to ensure habitat for this community continues in the locality.	Post- construction phase	Proponent
Weed Removal	The following three (3) Priority Weeds were identified within the Project Area:  • Olea europaea subsp. cuspidata (African Olive);  • Rubus fruticosus species aggregata (Blackberry); and  • Senecio madagascariensis (Fireweed).  All priority weeds should be removed in accordance with the Biosecurity Act 2015 and NSW WeedWise (DPI 2024). Environmental weeds should be managed with best practice techniques to improve the condition of	Post- construction phase	Proponent
Storage and stockpiling (soil and materials)	Allocate all storage, stockpile, and laydown sites away from any native vegetation that is planned to be retained. Avoid importing any soil from outside the site as this can introduce weeds and pathogens to the site to avoid the potential of incurring indirect impacts on biodiversity values.	Construction phase	Construction Contractors

## 7. Conclusion

This assessment indicates that the relevant provisions of the Environmental Planning and Assessment Act 1979, Biodiversity Conservation Act 2016, Environment Protection and Biodiversity Assessment Act 1999, the State Environmental Planning Policy (Industry and Employment) 2021, and the Mamre Road Precinct Development Control Plan 2021 have been satisfied.

Part of the Project Area has been nominated as 'Certified-urban capable land' under the Cumberland Plain Conservation Plan (CPCP). Development in these areas do not require further biodiversity assessment under the BC Act. However, other parts of the Project Area that are mapped as 'Excluded Land' or 'Avoided Land' still require biodiversity assessment under the BC Act and are the focus of this report.

The Department of Planning and Environment is currently pursuing Commonwealth approval for the CPCP under Part 10 of the EPBC Act. Landholders can submit development applications, seek subdivision or start master planning. However, development that will have a significant impact on matters of national environmental significance (MNES) on certified - urban capable land cannot commence until the Commonwealth CPCP approval is in place.

In summary, the following vegetation communities (located outside of Certified-urban Capable Land) within the Project Area will be impacted by the proposed activity:

- 0.23ha of Cumberland Shale Plains Woodland.
  - Conforms to the BC Act listed Cumberland Plain Woodland in the Sydney Basin Bioregion (CEEC); and
- 4.29ha of Exotic Vegetation.

A BC Act Test of Significance (5-part Test) and an EPBC Assessment of Significant Impact was conducted for all threatened entities considered to have the potential to be impacted by the proposed activity. It was then concluded that the proposed activity will not have a significant impact on any threatened entities.

Appendix D. BC Act Assessment of Significance (5-part Test) for Cumberland Plain Woodland in the Sydney Basin Bioregion.

Biodiversity Co.	nservation Act 2016 – Test of Signifi	icance (5-part Test)		
for Cumberland Plain Woodland in the Sydney Basin Bioregion (CPW)				
BC Act Status: Critically Endangered Ecological Community				
Background to Test	This Test of Significance (5-part Test) is required to assess impacts to Cumberland Plain Woodland in the Sydney Basin Bioregion that is being impacted by the proposed activity. However, as Part of the Project Area has been nominated as 'Certified-urban capable land' under the CPCP, only areas that are mapped as 'Excluded Land' or 'Avoided Land' are required to be assessed. Therefore, only 0.23ha of Cumberland Plain Woodland (CPW) will be assessed within this 5-part Test			
(a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction,	Not applicable.			
(b) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity:	(i) is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or	The proposed activity is not likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction.  In total, 0.26% of the local occurrence of CPW. The removal of minimal low condition CPW is unlikely to have an adverse effect on the extent community such that its local occurrence is placed at risk of extinction.		
	(ii) is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	The proposed activity is not likely to modify the composition of CPW substantially and adversely such that its local occurrence is likely to be placed at risk of extinction. It is not expected that composition of species will be substantially or adversely modified by the proposed activity. The removal of 0.23ha of CPW is approximately 0.26% of its local occurrence.		
(c) in relation to the habitat of a threatened species or ecological community:	(i) the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and	In total, approximately 0.23ha of CPW is expected to be impacted by the proposed activity.		
	(ii) whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and	The area proposed to be impacted consists of a small area of roadside vegetation that has already been fragmented from areas of surrounding habitat.		

for	cance (5-part Test)		
lain Woodland in the Sydney Basin	Biodiversity Conservation Act 2016 – Test of Significance (5-part Test) for		
Cumberland Plain Woodland in the Sydney Basin Bioregion (CPW)			
BC Act Status: Critically Endangered Ecological Community			
(iii) the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	All areas which support viable patches of CPW are important. However, the vegetation within the Project Area is highly modified due to historic clearing and edge effects. In total 0.23ha of modified vegetation will be removed. As such, it is not anticipated the removal of this vegetation will impact on the long-term survival of this community within the locality considering the extensive areas located outside of Certified Land.		
The proposed activity is not likely to have an adverse effect on any declared area of outstanding biodiversity value, directly or indirectly.			
The following Key Threatening Processes (KTPs) listed under Schedule 4 of the BC Act are relevant to the protection of potential habitat in the scope of the proposed activity within the Project Area for this CEEC:  • Clearing of native vegetation.  The proposed activity will see a temporary increase in the impact on clearing of native vegetation.			
	(iii) the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,  The proposed activity is not likely to declared area of outstanding biodical to the BC Act are relevant to the poscope of the proposed activity with the proposed activity with the proposed activity will see a

# Biodiversity Conservation Act 2016 – Test of Significance (5-part Test) for Litoria gurea (Green and Golden Bell Frog.)

for Litoria aurea (Green and Golden Bell Frog)				
BC Act Status: Endangered				
Background to Test of Significance	This Biodiversity Conservation Act 2016 Test of Significance (5-Part Test) is for the removal of four (4) soaks which may provide habitat for following endangered species:  • Litoria aurea (Green and Golden Bell Frog).			
(a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction,	The proposed activity is not likely to have an adverse effect on the life cycle of this species such that a viable population of the species is likely to be placed at risk of extinction. The proposed activity involves the removal of four (4) small soaks dominated by exotic vegetation. Whilst these areas may potentially provide foraging and breeding habitat for the Green and Golden Bell Frog this habitat is considered suboptimal due to its highly disturbed nature located directly adjacent to a busy road. Furthermore, site assessments were conducted on consecutive years within the known calling time for this species and no individuals were located.			
(b) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity:	(i) is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or	Not applicable.		
	(ii) is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	Not applicable.		
(c) in relation to the habitat of a threatened species or ecological community:	(i) the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and	The proposal will involve the removal of four (4) soaks to facilitate the proposed works.		
	(ii) whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and	The four (4) soaks providing sub- optimal foraging and breeding habitat is proposed for removal and is already fragmented from other areas of habitat.		
	(iii) the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	All areas which support viable Green and Golden Bell Frogs are important however, given the highly degraded and fragmented nature of the soaks within the Project Area, it is unlikely to consist of important habitat for the species.  Better quality habitat will remain in		
(d) whether the proposed development or activity is likely to have an adverse effect on any	close proximity at Kemps Creek.  The proposed development is not likely to have an adverse effect on any declared area of outstanding biodiversity value, directly or indirectly.			

## Biodiversity Conservation Act 2016 – Test of Significance (5-part Test) for

Litoria aurea (Green and Golden Bell Frog)

BC Act Status: Endangered		
declared area of outstanding biodiversity value (either directly or indirectly),		
(e) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.	The following Key Threatening Processes (KTPs) listed under Schedule 4 of the BC Act are relevant to the protection of potential habitat in the scope of the proposed activity within the Project Area for this species:  • Clearing of native vegetation.  The proposed activity will see a temporary increase in the impact on clearing of native vegetation, however this is expected to be extremely minimal based on the low percentage of native species located within the soaks

## Commonwealth Environment Protection and Biodiversity Conservation Act 1999 Assessment of Significant Impact Criteria

for

#### Litoria aurea (Green and Golden Bell Frog)

**EPBC Act Status: Vulnerable** 

#### Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

 Lead to a long-term decrease in the size of an important population; The proposed activity is will not lead to a long-term decrease in the size of an important population. Site assessments were conducted over the course of two (2) years within the known calling time for this species and no individuals were located.

The proposed activity will result in impacts to one (1) small dam and four (4) small roadsides soaks. These features may provide breeding or foraging habitat for the Green and Golden Bell Frog. These features however are in low condition, surrounded by degraded roadside vegetation. As such, any potential disturbance to this species is likely to be temporary and localised, with better condition habitat (Kemps Creek) being untouched in the surrounding locality.

 Reduce the area of an occupancy of an important population The proposed activity will not reduce the area of occupancy of an important population of species. Site assessments were conducted over the course of two (2) years within the known calling time for this species and no individuals were located.

Although the proposed activity may see a temporary reduction in potential habitat for the Green and Golden Bell Frog, the habitat is in low condition, and is surrounded by degraded roadside vegetation, thus providing less than optimal habitat for this species.

 Fragment an existing important population into two or more populations; The proposed activity will not fragment an existing important population into two or more populations.

Site assessments were conducted over the course of two (2) years within the known calling time for this species and no individuals were located.

 Adversely affect habitat critical to the survival of a species; The proposed activity will not adversely affect habitat critical to the survival of this species as the proposed works require the impacts to one (1) dam and four (4) roadside soaks, which are surrounded by degraded vegetation thus only providing sup-optimal potential habitat for this species.

Disrupt the breeding cycle of an important population;

The proposed activity will not disrupt the breeding cycle of an important population. Site assessments were conducted over the course of two (2) years within the known calling time for this species and no individuals were located.

Extensive potential breeding habitat in the form of higher condition dams and watercourses (Kemps Creek) will continue to exist post-construction, in the surrounding area.

 Modify, destroy, remove, isolate or decrease the availability or The proposed activity will not modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the

## Commonwealth Environment Protection and Biodiversity Conservation Act 1999 Assessment of Significant Impact Criteria

for

#### Litoria aurea (Green and Golden Bell Frog)

**EPBC Act Status: Vulnerable** 

#### Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

quality of habitat to the extent that the species is likely to decline; species is likely to decline. Although the proposed activity will result in the removal of one (1) dam and four (4) roadside soaks, this impact will not have a significant impact on the availability of habitat for the Green and Gold Bell Frog and will not lead to a decline in the species.

 Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat;

Priority and environmental weeds were a significant issue within the Project Area and will be cleared and managed appropriately. No invasive species will be introduced into the Project Area as a result of construction works, thus there will not be further threats to potential Green and Gold Bell Frog habitat.

 Introduce disease that may cause the species to decline; or The proposed landscaping may involve the importation of soil, compost or mulch which may be a potential source of chytrid fungus (a cause of amphibian chytrid fungus disease). If materials are to be imported for landscaping processes, they will be sterilised according to industry standards prior to importation to site.

Interfere with the recovery of the species.

The proposed activity will not interfere with the recovery of the species. While potential sub-optimal breeding and foraging habitat, in the form of one (1) dam and four (4) soaks, will be impacted by construction works, it is considered highly unlikely that the removal of potential habitat will interfere with the recovery of the species. Potential impacts are to be mitigated through the measures outlined in this report including the requirement for a qualified Ecologist to be present on-site during clearing of this potential habitat to supervise works and provide assistance to any individuals of this species directly impacted.
