

The Five Siblings Problem

Created by Sian Zelbo, 1001mathproblems.com

The Diaz family has five children; three boys and two girls. They were all born in different years, but are close in age, so it is hard to work out the birth order.

Here's what we know:

- 1 Every girl who has a younger brother has exactly one older brother.
- 2 Every boy who has an older sister has exactly one younger sister.

Question

What is the birth order of the five siblings (by gender)?
