

BARASTOC

SUPREME

Not all protein is created equal!

When looking at protein in a horse's diet it's important to consider the level of amino acids, which are critical for building muscle and topline.

Amino acids are the building blocks of protein, and the essential amino acids required in the diet for building muscle are branched chain amino acids. Branched Chain Amino Acids (BCAA) work by assisting the growth and repair of muscles during exercise, and supporting muscle preservation. These essential amino acids assist in adding more muscle/topline by increasing protein synthesis.

Supreme contains, Lysine and Methionine as well as BCAA Leucine, Valine, Isoleucine and Glutamic acid.

Providing a diet that is balanced in protein and with the correct amount of nutrients, including vitamins and minerals for biochemical reactions, muscle repair and recovery is optimum in building topline.

Barastoc Supreme is perfectly suited to the performance horse, with extra benefits in gastrointestinal health and antioxidants to support the equine athlete.

Barastoc Supreme also contains Diamond V XPC to improve utilization of fiber and minerals and create a healthy gut microbiome, as well as Barastoc Gastrolize - a stomach & hindgut buffer that aids in increasing intestinal pH, reducing discomfort associated with EGUS.

In addition, Barastoc Supreme contains higher levels of Selenium and Vitamin E for superior antioxidant function, in addition to immune and muscle system support.

horses come first
