

ekd gelenkrohr

energy chains and
energy chain systems
in steel and plastics

ekd gelenkrohr is manufacturer of energy chains since 1970. From the founding product energy pipe is formed today a wide range of energy chains and energy chain systems, which provides the standard of energy chains in steel and plastic up to plug in speciality products and tailor-made solutions with cables, connectors and mounting kits for every application. The service spectrum ranges from the selection and design of appropriate energy chains, electrical and hose lining to final assembly and commissioning on site.

In addition to standardized series products in steel and plastics special products are a priority of the ekd product range, which are designed and made of materials in accordance to customers requirements.

This product range contents the energy chain itself up to energy chain components and plug and play ready complete systems, which are named as energy chain systems.

The headquarter in Erkrath in plant 1 comprises the administration, the mold injection area with an attached tool manufacturing, machining centers, the final assembly and shipping area and the stock 1.

Stock 2 and the manufacturing of assemblies and complete systems are organized in the adjacent second factory .

Injection molding: part series Kolibri

The proximity and the organization of the individual process design and manufacturing areas in a certified Quality Management System (ISO 9001:2008) enable customer-oriented and fast processing of requests from the initial project outline to delivery - no matter whether standard or custom solutions.

Selection of the energy chain and material

For most applications energy chains made of plastic is your first choice. Chemical resistance, light weight and low costs are the major advantages. Steel chains are used under extreme payloads and high mechanical or other particular requirements. For extreme cycles the hardened (carburized) steel is required to achieve long life.

Calculation of cross-section

First, the cross-section required for the wires is determined, and then specific motions or arrangements, aggressive environmental conditions or other factors lead to your selection.

A pre-selection of the product series may use the fields of application (see product series chapter).

All lines must be able to move freely in the energy chain. This requires an individual clearance to be taken into account for each line:

round cable:	10% of the diameter
flat cable:	10% of the cable width and height
hoses:	20% of hose diameter

Optimum requirement is the separation of all lines by means of individual chambers. Especially with varying diameters or multi-layer wiring a separation by vertical and horizontal dividers is required.

If several lines are to be laid in one chamber, the chamber dimensions have to be restricted so that they maintain their relative positions.

Even multi-layer arrangements of flat cables have always to be separated with horizontal dividers.

When using pressure hose a change in length has to be taken into account through additional clearance in the chain bow (radius), which can be achieved by a corresponding chain height (a).

The distribution of the energy chain cross-section should be symmetrical in order to ensure an uniform load. In addition heavy lines are laid out close to the links to minimize the bending loads on the transverse bars.

Determination of the bending radius

The bending radius of the energy chain is determined by the minimum permissible bending radius of the cables and hoses, the available installation space and the polygon oscillation PA of the energy chain.

In general, a minimum bend radius of $10d$ is considered, where d is the largest existing line diameter. Cables with smaller minimum bend radii are available by some manufacturers.

The polygon oscillation PA influences the moving of an energy chain. A large bend radius at the same pitch results usually in a calmer movement of the energy chain.

The installation space must have a height of more than $2R + c$, where R is the set-radius and c is the link height of the energy chain. The real radius is the set radius $+0/-5\%$. The pretension of the energy chain should also be considered.

Energy chain length

In standard applications the fixed connector of the energy chain is arranged in the middle of the travel distance. The moving connector moves horizontally over the fixed connector between the end positions of the travel. The required length of the energy chain between the first and the last pivoting link is then determined as follows:

$$L = \frac{Lv}{2} + 4 R$$

L length of the energy chain
Lv length of travel
R bending radius of the energy chain

If the fixed connector is not in the middle of the travel, the energy chain has to be extended by a displacement of x:

$$L = \frac{Lv}{2} + 4 R + x$$

x offset of the fixed connector

After the selection of the energy chain, the length is rounded up to the link pitch. This length is the ordering length of the energy chain.

The connectors height is double bend radius plus link height:

$$HA = 2 R + c$$

HA connector height
c link height of the energy chain

Review of the free carrying length

The additional load is the weight of all cables and hoses, divided by the length of the chain:

$$ms = \frac{mL}{L}$$

mL cable weight
ms specific additional load

Thus with calculated additional load and the help of the load diagram the free carrying length of the energy chain can be verified.

If the additional load is too high for a particular chain an energy chain with greater free carrying length is chosen or constructive changes have to be done that allow the operation with the chosen energy chain (eg, gliding arrangement, support rollers, SYSTEM MARATHON or similar).

Pretension and permissible sag

ekd energy chains are supplied with pretension. Exceptions are energy chains for vertical or sliding arrangements as well as on the side lying energy chains, for example, in a circular arrangement.

The pretension is a manufacturing tool to achieve energy chains with increased free carrying lengths.

The values for the pretension is set by the manufacturer. ekd energy chains made of steel are manufactured with 5 mm / m and plastic energy chains up to 25 mm / m as pretension with no load.

The sag is due to the additional load and the weight of the energy chain. Due to the significantly lower elongation of steel (0.2% linear elongation) compared to plastics the permissible sag of the steel chains is limited lower than for plastic energy chains.

On the other hand, the effect on plastic energy chains of a long-term static load with a long unsupported length of the upper strand chains will increase the sag (creeping of plastics).

Elevated temperatures and humidity increases this effect. The sag of energy chains is also increased by use-wear.

The maximum allowable sag can only be judged in the assessment of all operating conditions. Within the limits for the free carrying length specified in the load diagram the sag is within the permissible range at normal operating and environmental conditions.

In addition the following factors have to be taken into account:

Using toughs and slow moving energy chain sag is limited.

For high accelerations and high travel speeds too much sag is a problem. A defined force application at the moved connector is not guaranteed and uncontrollable chain oscillations can occur. Thus the energy chain material is subjected to extreme dynamic stresses.

In such cases, corrective steps should be taken.

The first step is the selection of an energy chain with increased free carrying length. If this can not be done, these are the following alternatives:

Support rolls and support rails

Support rollers can increase the maximum travel L_v of steel chains by up to four times the free carrying length L_f .

With additional support rollers and a support rail the maximum range of movement can be expanded up to eight times the free carrying length.

The use of support rollers with support frames, is limited to speeds below 1 m/s.

Raised trough

This type is mainly used with plastic energy chain applications. As with the use of support rolls the maximum travel can be increased up to four times the free carrying length.

Because of the larger permissible sagging, support rolls are not suitable for plastic energy chains.

Support carriage

For long travel distances and high additional loads support carriages can be used with reverse travelling energy chains. The side-mounted support rolls carry the energy chain and move the support carriage.

The energy chains now only face pull forces and through this an extremely long life is achieved even at high additional loads.

SYSTEM MARATHON

The patented SYSTEM MARATHON for unlimited travel is also designed for high speeds and high accelerations. The upper run is running with supporting rollers over the entire travel on continuous flat rails and the rollers swing in the radius to lay down the energy chain at the bottom profile. In the back movement the rollers swing out again and lead the energy chain without wear over the entire travel. The SYSTEM MARATHON is not dependant upon the type of energy chain and therefore steel energy chains are as equally suitable as plastic energy chains.

Gliding energy chains

Gliding energy chains require guiding the upper run in a continuous trough. In addition, the first half of travel slide bars are mounted on the energy chain is extended via the fixed end in the middle of the travel out up to the starting point to create a continuous gliding plane (see also chapter troughs).

With high dynamic demands on the energy chain, lowering the moving connection end may be necessary to result in a better introduction of push forces into the energy chain.

In travels over 30 m, velocities above 1.5 m / s and acceleration of 1 m/s² lowering the moving end is recommended and requires an additional length of the energy chain. Chain links with a opposite bend radius minimize the required additional length and minimize oscillations of the remaining free carrying length of the energy chain.

PKK, PLE and SLE energy chains for gliding arrangements are preferably equipped with sliders that can be replaced after reaching the wear limit without dismantling or replacing the energy chain.

B = moving connector
F = fixed connector
normal
(not specified in order)

ARRANGEMENTS

normal arrangement (n)

In the **normal** arrangement the fixed connector is usually on the first link in the lower strand in the middle of the travel.

The moving end connector is moving the chain in a straight line lengthwise at a height of $2R+c$ over the entire travel. The upper strand is steadily reduced through the bending of the individual links until the whole chain length is taken to the bottom or in a trough.

This arrangement allows maximum speeds and extreme acceleration with optimum durability.

multiaxial (m)

In the **multiaxial** arrangement is a vertical and horizontal motion of the driver along the x-axis (travel direction) and one or more movement in the y- or z-direction. While running in the y-direction may be done by any conventional energy chain, the movements in the z-direction require the energy chain system ALLROUND.

free overhang (f)

In contrast to the normal arrangement the freely exceeding lower strand is supported only partially by a substructure.

Due to the high weight load on the lower strand in this arrangement only significantly reduced travel distance is possible.

moved end downside (u)

If the driver is positioned in the lower, due to the heavy weight only a reduced travel distance is possible (see above).

nested travel (i)

The arrangement of two or more energy chains with different bending radii or even different energy chains makes sense when using a variety of cables and hoses together. The energy chains are moved together by a common driver.

gliding arrangement (l)

If the free carrying length is exceeded, the energy chain changes into a gliding state. In this arrangement, use energy chains without pretension. A trough is required (see chapter troughs). Sliders increase the lifespan and can be replaced if necessary.

vertical travel (s)

Vertical travel arrangements are often installed in systems in which multiple linear axes are coupled. In this arrangement usually energy chains without pretension are used. Vertical arrangement with multiaxial movement needs chains with pretension.

The weight of the lines and of the energy chain has to be placed and pushed by the straight part of the chain. This forces should be caught by a supporting.

The energy chain should be arranged so that optional cross accelerations are in the y-direction

vertically hanging (h)

Elevators, high-bay stores and doors are typical applications for energy chains in vertically hanging arrangement. In this arrangement the energy chain is predominantly tensile stressed. Lateral acceleration should be layed if any, in the y-direction. Energy chains are without pretension.

hanging multiaxial (hm)

The energy chain ALLROUND provides the combination of linear and rotary motion.

horizontal (w)

on the side

Energy chains are arranged horizontally lying on their side, for example, if the space does not allow a normal arrangement. In some cases, lying on its side provides an alternative for very long traverse at low speeds and strokes. In this application mainly chains without pretension are used.

In general, suitable guide troughs and gliding discs or rollers are required.

driving apart (a)

With energy chains moving apart the calculation of the energy chain length does not follow the usual pattern, but be adapted to the individual requirements of the application.

circle (k)

on the side

The circular motion is a special form of chain movement. For circle movement a part of the energy chain has to be manufactured with an opposite bending radius R2.

The outer radius R3 is derived from the link height, the bending radius of the energy chain R1 and the opposite radius R2.

This type of horizontal arrangement allows rotation up to 520°. A customized guide channel is required.

For laying in energy chains only highly flexible cables with permissible bending radii and sufficient dynamic capacity suitable. The cables have to be laid twist free to move freely lengthwise. Cable on a reel should be unrolled in the reverse winding direction and placed in the extended state in the energy chain. For intermediate storage the lines are ideally laid out straight. The material relaxation occurs in this case facilitates a twist-free installation.

The distribution of the chain interior must prevent mutual interference between the wires with dividers or wrap clamping of different diameters safely, so that each line can move freely in the longitudinal direction (see design guidelines). In particular in the energy chain radius tensile stressed wires increase wear drastically and reduce the reliability. A fixation of the wires or a bundle of several lines using cable ties or the like within the energy chain can also cause damage.

Strain Relief

With long travel distances and high speeds the cables should be attached with strain relief only at the driver end. For free carrying energy chains recommend for aesthetic reasons, a strain relief on both ends. The distance of strain relief to the bending stressed area depends on the particulars of the line manufacturer. Hydraulic hoses have special needs.

Integrated strain relief

In this space-saving type the strain relief is directly attached to the plastic dividers (PZ) in the first link of the energy chain (note the mounting direction of PZ!).

In order to avoid premature line wear caused by dynamic loads, a small excess length of the chain is recommended.

Combined strain relief

The combined strain relief combines the advantage of a sufficient distance from the bending line areas to the strain relief by the simple and space-saving installation of the integrated strain relief. The anchor profile is provided to the drilling dimensions of the energy chain and attached to the chain.

The lateral insertion and extraction of strain relief elements is through the C-profile.

Separate strain relief

The separate strain relief is recommended for high dynamic loads and large line diameters. A sufficient distance of the strain relief to the moved line areas and length compensations are easy to implement. In this variant the lateral insertion and extraction of the strain relief elements with no installation work on the cable carrier is possible.

STRAIN RELIEF

anchor profile ZLP

The aluminum anchor profile is used to mount various strain relief elements. Both the distance to the energy chain as well as the positioning of the strain relief elements can be easily designed. The length of the anchor profile and the drilling dimensions are determined by the dimensions of the energy chain.

strain relief stay ZLS

The strain relief stay was developed for anchoring the blue ribbon and the cable anchor. The design of the strain relief stay is closely based on the plastic divider (PZ). It is installed laterally into the anchor profile or a commercially available C-profile and can add several strain relief elements through the stay.

blue ribbon ZLB 24

The Blue Ribbon is a special ekd cable tie with a 24 mm wide cable mounting. The Blue Ribbon can be locked on the strain relief stay or the plastic divider (2mm, 4mm). Cables with diameters of 7 mm up to 35 mm can be fixed single or multiple (s-shaped) with the Blue Ribbon.

cable anchor ZLA8

Connect the lines with standard cable ties to the cable anchor (single or double slide) and push on the plastic divider.

A multi-layer connection of wires with this is as easy as possible, with the simple removal to carry out maintenance work.

sliding anchor ZLS 10

The line is mounted with commercially available cable ties at the sliding anchor which is inserted into the aluminum C-profile. The simple movement of the sliding anchor provides a generous assembly space.

horn stay ZHS 10

The horn stay ZHS10 is transversely inserted into the anchor profile and locked by a 90 ° rotation. It is therefore permanently positioned in the anchor profile. The line is mounted with cable ties at the horn stay.

ZHS10
part.no.1407

The horn stay HS 65 and HS 85 are components of the integrated strain relief for the rigid version of the chain series Kolibri. HS 55 and HS 75 are for the standard versions of the chain series Kolibri.

For the series PKK the horn stay HS 220 and HS 320 deliverable.

The horn stays are attached to the stay of the chain connecting link.

HS65
part.no.1503

HS85
part.no.1504

yoke clamps

Commercial yoke clamps can be used as a separate strain relief and are mounted with the aluminum C-profile of the SLE 520 or SLE 320 in front of the energy chain connectors.

As an integrated strain relief they are inserted directly into the first and last chain link of the SLE and PLE.

General operating and safety instructions

Energy chains are technical products which are designed and sized as part of an engineering-design according to a specific use. Dealing with this products in accordance with the generally recognized rules of operating and safety rules have to be followed in dealing with these products. Observe the accident prevention regulations. Additional requirements, such as when operating in hazardous areas are to take into account.

Electrical conductiv energy chains have to be grounded in every case.

Proper use requires the observance of the dimension limits of the energy chains. The following experiences from practice shows errors can lead to significant functional impairment or damage of energy chains:

- Improper handling of the energy chain for transport and assembly due to weight load of the energy chain, especially an unsupported application.
- Contamination from such items as coarse shavings can cause damage to your lines.

If this can not be avoided in the operating in abrasive conditions such as abrasive dust entry or vibrations, so trough appropriate design and inspection intervals, particularly in unsupervised, automated operating systems to avoid unexpected machine failure.

The order for ekd energy chain includes the following information:

The energy chain selection is based on the diameter and number of cables to be laid. A clearance of at least 10% for cable and 20% for hoses should be available. The choice of plastic or steel energy chain, and between open and closed design and operating conditions.

The radius is also dependent on the cables to be installed. Comply with the specifications of the manufacturer. 10 times the largest line diameter can be a general rule.

The length of the chain depends on the travel distance. The following formula can be used:

$$L = \text{travel distance} / 2 + (4 \times \text{radius}) \text{ (round up to link pitch)}$$

Kolibri, PKK and PLE energy chains can be supplied with additional connector links (see figure below).

The width of the chain depends on the number and dimension of the cables to be installed. With slow applications cables can be installed on top of one another, creating extra space.

ekd plastic energy chains with integrated connectors need no additional connector parts. In case of special connector constitutions the order text lists first the fixed connector then the moving connector

The arrangement is only to be stated in special cases.

order examples:

Kolibri CHARACTERISTICS

The inexpensive energy chain for light-weight applications. The patented opening offers high rigid torsion behaviour and comfortable handling in one.

- easy access by flap stays
- extremely rigid and wear resistant
- unique separation with the pinch stay
- smallest dimensions

All ekd plastic energy chains are equipped with integrated connectors. Additional mounting parts are not needed.

Dimensions

bending radii:	15	to	400 mm
inner height:	7	to	50 mm
inner width:	7	to	195 mm
weight:	0.06	to	2.7 kg/m

Travel distance

The maximum travel distance is given by the arrangement and the load (weight of the lines). At normal arrangements the maximum travel distance is double the free carrying length. Support rollers or similar equipment may exceed this value.

In gliding arrangements travel distances up to 100 m are possible (according to the application). For longer travels see chapter on design guidelines.

Travel speed

There are no limits for the travel speed in general. But with gliding arrangements application specific influences have to be taken into account.

Acceleration

There are no limits for the accelerations, in general. Limits may occur through the tensile stresses at high line weights.

Temperature

Long term temperature limits are between -20°C and 100°C.

Special variants

ELTOLA	... silent running
ATEX	... EX-protection
ESD	... antistatic
V-0	... self extinguishing

3) additional R400

4) only Kolibri 30.080.5

Kolibri HEIGHT 10

inner height 7 up to 8, inner width 7 up to 14

Kolibri 10.012.4

one part link
film stay in inner radius
integrated connector or separate connectors
space (axb): **Ø7** **not separable**
bend radius: 15 / 30 / 50
weight: 0,05 kg/m
free carrying length: 0.4 m at 0.3 kg/m load
pitch: 15

order example:

Kolibri 10.012.4 / 50 x 1005

type / radius x length

Kolibri 13.023.4

one part link
fether stay in inner radius
integrated connector
space (axb): **8x14** **not separable**
bend radius: 17,5 / 35 / 55 / 80 / 100
weight: 0,12 kg/m
free carrying length: 0,8 m at 0.5 kg/m load
pitch: 20

order example:

Kolibri 10.012.4 / 50 x 1005

type / radius x length

fether stay long
max. Ø5mm

fether stay short
Max. Ø8.5mm

Snap

(see page 26,32,39,41)

Kolibri HEIGHT 15

inner height 10, inner width 10 to 39

Kolibri 15.015.3

one part chain link
not openable
connector as separate part (part.no. 0700)
space (axb): Ø10 not separable
bend radius: 17.5 / 20 / 30
weight: 0.15 kg/m
free carrying length: 0.9m at 0.9 kg/m load
pitch: 20

order example:

Kolibri 15.015.3 / 30 x 1000

type / radius x length

Kolibri 15.015.4

one part chain link
film-stay in inner radius
connector as separate part (see Kolibri 15.015.3)
space (axb): Ø10 not separable
bend radius: 20 / 30
weight: 0.15 kg/m
free carrying length: 0.9 m at 0.9 kg/m load
pitch: 20

order example:

Kolibri 15.015.4 / 30 x 1000

type / radius x length

Kolibri 15.036.5

closed type
flap covers in outer radius
integrated connectors
space (axb): 10 x 25 not separable
bend radius: 30 / 50
weight: 0.3 kg/m
free carrying length: 0.9m at 0.9 kg/m load
pitch: 18

order example:

Kolibri 15.036.5 / 30 x 1008

type / radius x length

Kolibri HEIGHT 15

inner height 10, inner width 10 to 39

Kolibri 15.037.3

one part chain link

not openable, closed in outer radius

integrated connectors

Space (axb):	10 x 24 not separable	
bend radius:	24, 30	
weight:	0.3	kg/m
free carrying length:	0.9	at 0.9 kg/m load
pitch:	20	

order example:

Kolibri 15.037.3 / 30 x 1000

type / radius x length

Kolibri 15.051.0

standard type

flap stay in inner radius

integrated connectors

space (axb):	10 x 39 not separable	
bend radius:	20 / 30	
weight:	0.35	kg/m
free carrying length:	0.9 m	at 0.9 kg/m load
pitch:	20	

order example:

Kolibri 15.051.0 / 30 x 1000

type / radius x length

Kolibri HEIGHT 22

inner height 16 to 22, inner width 15 to 48

Kolibri 22.025.4

one part chain link
film stay
integrated connectors

space (axb): 17 x 15 not separable
bend radius: 35 / 70 / 100
weight: 0.20 kg/m
free carrying length: 1.3 m at 1.5 kg/m load
pitch: 30

order example:

Kolibri 22.025.4 / 35 x 1020

type / radius x length

Kolibri 22.038.0

standard type
flap stay in inner radius
integrated connectors

space (axb): 17 x 27 separable (PZ ANr.1688)
bend radius: 35 / 50 / 70 / 100
weight: 0.34 kg/m
free carrying length: 1.5 m at 1.0 kg/m load
pitch: 26

order example:

Kolibri 22.038.0 / 35 x 1040

type / radius x length

Snap

Assembly example:

Kolibri 22.038.0 is available
with Snap connectotr:

Quick and toolless assembly of the
energy chain with only one click.

Please contact the ekd gelenkrohr design department.

Kolibri 22.038.1

open type
flap stay in outer radius
integrated connectors

space (axb): 17 x 27 separable (PZ ANr.1688)
bend radius: 35
weight: 0.34 kg/m
free carrying length: 1.5 m at 1.0 kg/m load
pitch: 26

order example:

Kolibri 22.038.1 / 35 x 1040

type / radius x length

Kolibri HEIGHT 22

inner height 16 to 22, inner width 15 to 48

max. 14-20

Kolibri 22.048.0

open type

flap stay in inner radius

integrated connectors

space (axb): 17 x 36 not separable

bend radius: 35 / 70

weight: 0.37 kg/m

free carrying length: 1.3 m at 1.5 kg/m load

pitch: 30

order example:

Kolibri 22.048.0 / 35 x 1200

type / radius x length

Kolibri 22.060.5

closed type

flap stay in outer radius

integrated connectors

space (axb): 16 x 48 separable (PZ ANr.1294)

bend radius: 50 / 70 / 100

weight: 0.54 kg/m

free carrying length: 1.3 m at 1.5 kg/m load

pitch: 26

order example:

Kolibri 22.060.5 / 100 x 1014

type / radius x length

Kolibri HEIGHT 30

inner height 23 to 24, inner width 18 to 109

Kolibri 30.030.3

one part chain link
not openable
integrated connectors

space (axb): 24 x 18 not separable
bend radius: 40 / 100 / 200
weight: 0.50 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 40

order example:

Kolibri 30.030.0 / 100 x 1200

type / radius x length

Kolibri 30.050.0

standard type
flap stay in inner radius
integrated connectors

space (axb): 23 x 34 separable (PZ ANr.1258)
bend radius: 40 / 60 / 75 / 100 / 150 / 200
weight: 0.54 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.050.0 / 100 x 1225

type / radius x length

Kolibri 30.050.1

open type
flap stay in outer radius
integrated connectors

space (axb): 23 x 34 separable (PZ ANr.1258)
bend radius: 40 / 60 / 75 / 100 / 150 / 200
weight: 0.54 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.050.1 / 100 x 1225

type / radius x length

Kolibri 30.050.5

closed type
flap covers in outer radius
integrated connectors

space (axb): 23 x 34 separable (PZ ANr.1017)
bend radius: 60 / 75 / 100 / 150 / 200
weight: 0.58 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.050.5 / 100 x 1225

type / radius x length

Kolibri HEIGHT 30

inner height 23 to 24, inner width 18 to 109

Kolibri 30.060.0

standard type
flap stay in inner radius
integrated connectors

space (axb): 23 x 44 separable (PZ ANr.1258)
bend radius: 40 / 50 / 75 / 100 / 150 / 200
weight: 0.61 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.060.0 / 100 x 1225

type / radius x length

Kolibri 30.060.1

open type
flap stay in outer radius
integrated connectors

space (axb): 23 x 44 separable (PZ ANr.1258)
bend radius: 40 / 50 / 75 / 100 / 150 / 200
weight: 0.61 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.060.1 / 100 x 1225

type / radius x length

Kolibri 30.060.3

open type
not openable
integrated connectors

space (axb): 24 x 48
bend radius: 40 / 100 / 150 / 200
weight: 0.60 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 40

order example:

Kolibri 30.060.3 / 100 x 1200

type / radius x length

Kolibri 30.080.0

standard type
flap stay in inner radius
integrated connectors

space (axb): 23 x 64 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.65 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.080.0 / 100 x 1225

type / radius x length

Kolibri HEIGHT 30

inner height 23 to 24, inner width 18 to 109

Kolibri 30.080.1

standard type
flap stay in outer radius
integrated connectors

space (axb): 23 x 64 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.65 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.080.0 / 100 x 1225

type / radius x length

Kolibri 30.080.2

rigid type
flap stay in inner radius
integrated connectors

space (axb): 21 x 64 not separable
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.7 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.080.2 / 100 x 1225

type / radius x length

Kolibri 30.080.4

one part chain link
lining without assembly
integrated connectors

space (axb): 21 x 64 not separable
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.65 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.080.4 / 100 x 1225

type / radius x length

Kolibri 30.080.5

closed type
flap covers in outer radius
integrated connectors

space (axb): 23 x 64 separable (PZ ANr.1017)
bend radius: 60 / 75 / 100 / 150 / 200
weight: 0.7 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.080.5 / 100 x 1225

type / radius x length

Kolibri HEIGHT 30

inner height 23 to 24, inner width 18 to 109

Kolibri 30.095.0

standard type
flap stays in inner radius
integrated connectors

space (axb): 23 x 79 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 125 / 150 / 200
weight: 0.75 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.095.0 / 100 x 1225

type / radius x length

Kolibri 30.095.1

open type
flap stays in outer radius
integrated connectors

space (axb): 23 x 79 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 125 / 150 / 200
weight: 0.75 kg/m
free carrying length: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.095.1 / 100 x 1225

type / radius x length

Snap

toolless assembly
of the chain

Kolibri HEIGHT 30

inner height 23 to 24, inner width 18 to 109

Kolibri 30.125.0

standard type
flap stay in inner radius
integrated connectors

space (axb): 23 x 109 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.87 kg/m
free carrying: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.125.0 / 100 x 1225

type / radius x length

Kolibri 30.125.1

open type
flap stay in outer radius
integrated connectors

space (axb): 23 x 109 separable (PZ ANr.1258)
bend radius: 40 / 75 / 100 / 150 / 200
weight: 0.87 kg/m
free carrying: 1.5 m at 2.0 kg/m load
pitch: 35

order example:

Kolibri 30.125.1 / 100 x 1225

type / radius x length

Kolibri with Snap

Type Kolibri allows using the Snap connector:
Fast and toolless assembly of the energy chain with only one click.
Please contact ekd gelenkrohr technic during your Planing phase.

assembly example:

Kolibri HEIGHT 40

inner height 31, inner width 48 to 60

Kolibri 40.062.2

rigid type

flap stay in inner radius

integrated connectors

space (axb): 29 x 48 separable ((PZ ANr.1521))

bend radius: 60 / 75 / 100 / 150 / 200

weight: 0.91 kg/m

free carrying length: 2.0 m at 1.0 kg/m load

pitch: 45

order example:

Kolibri 40.062.2 / 100 x 1260

type / radius x length

Kolibri 40.062.5

closed type

flap covers in outer radius

integrated connectors

space (axb): 29 x 48 separable ((PZ ANr.1268))

bend radius: 75 / 100 / 150 / 200

weight: 0.93 kg/m

free carrying length: 2.0 m at 1.0 kg/m load

pitch: 45

order example:

Kolibri 40.062.5 / 100 x 1260

type / radius x length

Kolibri HEIGHT 40

inner height 31, inner width 48 to 60

Kolibri 40.075.2

rigid type
flap stay in inner radius
integrated connectors

space (axb): 29 x 60 separable (PZ ANr.1521)
bend radius: 60 / 75 / 100 / 150 / 200
weight: 1.05 kg/m
free carrying length: 2.0 m at 1.0 kg/m load
pitch: 45

order example:

Kolibri 40.075.2 / 100 x 1260

type / radius x length

Kolibri 40.075.6

rigid type
flap stay in outer radius
integrated connectors

space (axb): 29 x 60 separable (PZ ANr.1521)
bend radius: 60 / 75 / 100 / 150 / 200
weight: 1.05 kg/m
free carrying length: 2.0 m at 1.0 kg/m load
pitch: 45

order example:

Kolibri 40.075.6 / 100 x 1260

type / radius x length

Kolibri 40.112.7

telescopic type
PKK stay in inner radius
separate connector

space (axb): 31x100 separable (PZ ANr.2035)
bend radius: 55 / 100 / 150 / 200 / 230
weight: 0,9 kg/m
free carrying length: 2,5 at 1,0 kg/m load
pitch: 37

order example:

Kolibri 40.112.7 / 55 x 1295 / 100

type / radius x length / stay length

stay length 50 up to 100

Kolibri HEIGHT 50

inner height 38 to 40, inner width 48 to 134

Kolibri 50.065.0

standard type
flap stay in inner radius
integrated connectors
space (axb): 40 x 48 separable (PZ ANr.1113)
bend radius: 75 / 100 / 125 / 150 / 200 / 250
weight: 1.30 kg/m
free carrying: 2.4 m at 1.0 kg/m load
pitch: 55

order example:

Kolibri 50.065.0 / 100 x 1265

type / radius x length

Kolibri 50.065.5

colsed type
flap covers in outer radius
integrated connectors
space (axb): 40 x 48 separable (PZ ANr.1113)
bend radius: 100 / 150 / 200 / 250
weight: 1.30 kg/m
free carrying length: 2.4 m at 1.0 kg/m load
pitch: 55

order example:

Kolibri 50.065.5 / 100 x 1265

type / radius x length

Kolibri 50.095.0 50.095.1

weight: 3.0 kg/m

free carrying length: 2.75 m at 1.0 kg/m load

pitch: 70

order example:

Kolibri 65.195.5 / 100 x 1400

type / radius x length

Pos. name

- 1 link (open type)
- 2 link (closed type)
- 3 flange pivot
- 4 flange drilling
- 5 horn stay connector
- 6 horn stay 65 HS65
- 7 horn stay 85 HS 85
- 8 damping element
- 9 PZ (divider)
- 10 PZ (pinch stay)
- 11 flap stay
- 12 flap cover
- 13 notched horizontal divider
- 14 notched horiz. divider flying
- 15 telescopic horizontal divider
- 16 telescopic horiz. divider flying
- 17 ladderstay
- 20 connector 10.012.4 hole
- 21 connector 10.012.4 pivot

Opening and closing

Push a screwdriver as shown in the the slot (1) then with a light lever movement (2) raise the tongue and push the locking pins of the flap stay (or the flap cover) out of the drilling. The flap stay can then be lifted (3). To remove the flap stay the second side has to be unlocked and the stay has to be pushed out against the direction of the cones.

The installation of the flap stays and flap covers are snapped in a slight angle with the pins against the corresponding drillings (4) and with slight pressure against the locking tongue.

Lifted flap stays can be re-engaged (5) with slight pressure.

Lengthening and shortening

To lengthen or shorten the flap stays have to be opened. The walls with pivot pins are to press internally (1) and the walls with the holes are to press toward the outside (2). The chain links can be pushed together (3), or be pulled apart.

Installation of the flap stays

The assembly of the flap stays can take place before or after cable lining. Therefore energy chain does not need to be opened. The flap stays are inserted from the outside chain link floor until snap (1), (2). The dismantling of the stays is done by unlocking the tongue and pushing out (3).

Assembly of horizontal dividers

The horizontal dividers (notched, telescopic and ladder-stay) are horizontally slid onto the vertical dividers (PZ) (1).

With a screwdriver the locking tongue can be mounted (2) and horizontal dividers disassembled (3).

Mounting the energy chain and strain relief

Before mounting the energy chain horn stays may be assembled which can be used to fix the lines via cable ties. For most applications variable strain relief is recommended, to mount the anchor profile with the energy chain using the integrated connector. (1), (2).

It is also possible to attach the anchor profile as a separate strain relief. The anchor profile is suitable for various strain relief components (see design guidelines).

Snap assembly

The energy chain may be assembled with only one click using the Snap connector. Horn stays will be clipped at the stays as strain relief elements. After that the energy chain can be clicked in the designated position.

Alternatively, it is possible to mount the cable chains with flush mountig flange type brackets (1).

Maintenance of the energy chain

Kolibri energy chains are maintenance free. Like every mechanical system there will - depending on the ambient conditions - wear which must be observed. In case of this the energy chainspace has to be exchanged.

PKK CHARACTERISTICS

A development from many years of experience, which combines all the advantages of plastic energy chains to one system:

- positive locking stays
- fast stay assembly and disassembly
- easy to shorten and lengthen
- the three-dimensional chain

All ekd plastic energy chains are equipped with the integrated plastic connector. Additional components for attaching the energy chain are not required.

Dimensions

bending radii:	40	to	500 mm
inner height:	16	to	80 mm
inner width:	30	to	400 mm
energy chain weight:	0.6	to	3.4 kg / m
(see dimensions)			

Travel

The maximum range of travel is determined by the arrangement and the additional weight (line weight). At normal arrangement the maximum travel is double free carrying length. Support rollers or similar constructive steps can increase this value.

Travel distances up to 100 meters are possible (see chapter on design guidelines).

Travel speed

There are no limits for the travel speed in general. But at gliding arrangements application specific influences have to be taken into account.

Acceleration

The acceleration is not subject to any restriction. Boundaries can only be achieved at high line tension forces encountered by the weights.

Temperature

Long term temperature limits are inbetween -20°C and 100°C.

1) The usable interior width is stay length - 2e minus the width of the used PZ

2) First latching the PZ (latching all 2mm); PKK 215, 225, 245, 315, 325, 345 i=22;

3) Dimension does not apply to the closed type

4) PKK 115 and 125 from R50, 215 and 225 from R100, 245, 315 and 325 from R150, 345, 525 and 515 from R200

5) The inner radius covers (ASI) of length 200 mm of the PKK 215, 225, 245 and 300 mm and 200 mm of the PKK 315, 325, 345 are designed with a pivot on one side.

6) PKK 228 from R100, PKK 328 from R150, PKK 528 from R200

PKK TYPES

PKK 120, 220, 320, 520

The standard version has a stay in every second link. With additional link bands and stays the chains can be extended as multibandchains. The **integrated connector** makes each link in the chain to a mounting link.

order example

PKK 220	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 110, 140, 210, 240, 310, 340, 510

The smooth designed PKK corresponds to the standard version, but has no exterior T-slot. These types provide a very good visual effect and a smaller width through the flat outside surfaces (also see PKK 215, PKK 245). The PKK 240 and 340 offer larger cross sections due to the increased link height.

order example

PKK 240	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 121, 221, 321, 521

The types PKK -21 are manufactured with a stay in each link. The additional stays increase the lateral stability and optimize guiding of particularly smaller cable diameter.

order example

PKK 221	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 111, 141, 211, 241, 311, 341, 511

These are the smooth designs with a stay in each link to increase lateral stability and optimize guiding of particularly small cables. PKK 241 and PKK 341 have a higher capacity due to their increased link height.

order example

PKK 241	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 113, 123, 143, 213, 223, 243, 313, 323, 343, 513, 523

The PKK with extension stays in the inner radius. Suitable for low speeds these stays create additional space. The extension stays can be arranged in the outer radius or in other combinations as per optional drawing. The extension stays are available in two lengths.

order example

PKK 223	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 125, 225, 325, 525

The closed designs offer optimum protection of the lines against chips or against UV radiation. The covers can be opened in the inner or outer radius. The closed types may also be subsequently created from the standard version.

PKK 115, 215, 245, 315, 345, 515

Without T-slot on the outside, the closed types achieve a good visual effect with their flat sides and a smaller width.

order example

PKK 215	/ 100	x	3510	/ 100
type	radius		length	stay length

PKK 228, 328, 528

The PKK 128, 228 and 328 with sliders are designed for gliding arrangements (long travel distances) and are fitted with stays in each link. The sliders are mounted in the inner radius of the energy chain and have a very low coefficient of friction ($\mu = 0.2$ to 0.25).

The sliders can also be installed afterwards. At low stroke rates and low speeds ($< 1\text{ m/s}$) sliders are not necessary. The smallest radius of each dimension of the PKK is not suitable for sliders.

order example

PKK 228	/ 100	x	3510	/ 100
type	radius		length	stay length

Multiband energy chains

Multiband energy chains can be created by attaching additional link bands. These are assembled through stays at standard energy chains (see assembly, except PKK with smooth exteriors).

order example

PKK 220	/ 100	x	3510	/ 100 / 100
type	radius		length	stay length / stay length

PKK ASSEMBLY

Packaging

ekd energy chains are supplied in transport friendly packaging. When removing the packaging and during removal of the energy chain or parts of it, ensure that the energy chains are free of torsion and tension, to avoid mechanical damage.

Lengthening or shortening, linkbands

Lengthening of the energy chain is done by fitting of energy chain pieces or links (1) and lock with spreader (2). To shorten the spreader is disengaged and removed, then the piece of chain removed.

Alternatively first link strands may be mounted and then stays assembled.

For the PKK the opposite link strands are rotated by 180 ° and arranged with the pivot on the inner chain.

Stay assembly

The stays with the locking tabs are put in the T-guide of the link (1) and push until it clicks into the guides (2).

The stays can be positioned initially in the T-guide and will be engaged in one swoop (plastic hammer or similar) in the final position.

Stay disassembly

The lock tongue of the stays are unlock with a screwdriver (1) and the stays pushed out with light pressure to the front of the T-slot (2). For medium and larger series (from PKK220) the stays can be unlocked with a light hit on the lock tongue (plastic hammer or similar) and then ejected.

Plastic divider PZ (vertical)

The PZ will be placed in the designated position on the stay (1) and engaged (2). The PZ can be mounted fixed or movable.

The dismantling is done by unlocking (3) and removal of the PZ.

Telescopic divider and ladder divider

The telescopic horizontal divider and ladder stay horizontally pushed onto the plastic divider (PZ) and engaged in the designated height (1). The disassembly is done with a screwdriver through pull (2) and removal (3).

PZ fork stays

The fork stays allow in combination with an additional stay a horizontal separation and several vertical separations. Fork stays are clipped upon the stays like plastic divider PZ (p.56).

Extension stays

The extension stays are pushed onto the link guides (1) and pivoted until it clicks (1). Then the stays are pushed into the guides until it clicks (3).

Covers

Before installing covers (ASA/ASI) first segment holder have to be pushed in the T-slot of the links (1). Then the covers can be plugged in (2). Covers and segment holder snap in the end position.

The covers are marked with arrows, to avoid wrong assembly direction.

Covers for the outer radius are equipped with holders for divider (PZ).

During assembly, ensure the correct overlap of the covers and that the covers are engaged on all four locking points.

The inner radius covers (ASI) of length 200 mm of the PKK 215, 225, 245 and 300 mm of the PKK 315, 325, 345 are designed with a pivot on one side. The cover has to be pushed into the T-slot of the link on its pivot side (1) and can swing to close or open (2). For that the cover holder has to be unlocked (see disassembly).

The dismantling of the covers is done by unlocking and lifting out. These are done one by one at a time with the 4 locking tongues on the segment holders using a screwdriver (1), then the cover is easy to raise.

With two release tools all four locking tongues can be done at once and the cover removed.

Attention:

The release tools can only be resolved if covers are dismantled (by lateral withdrawal)

Covers with lengths 200 mm and 300 mm of the PKK 225 and 325 are equipped with a pivot on one side. These covers opening mechanism is deactivated on one side. The covers can be swiveled.

Sliders

The sliders are mounted in the inner radius of the energy chain. The minimum bend radius in each PKK size can not be fitted with sliders.

During assembly of the sliders be aware of the following:

The sliders must be conditioned (water content min. 1%, overnight storage in water at room temperature or 2 h at 80 ° C).

Heat the slider just before mounting in a water bath.

Avoid impact load.

The dismantling is carried out channel lock pliers as shown and unlock slider by turning it to the outer side.

Multiband energy chains

Multiband energy chains can be created by attaching additional link strands. These are attached to existing energy chains by additional stays (see stay assembly). By combining with extension stays large hoses or other additional components may be carried.

Mounting the energy chain

All ekd plastic energy chains are equipped with the **integrated connector** (1). When using integrated strain relief, no additional components are needed. Provision for the combined strain relief, the anchor profile has to be screwed with the first link in the chain. Separate strain relief can be subsequently mounted.

Headside mounting

Optionally, the attachment can be made with flange connectors or universal connectors. The flange connectors are mounted in the T-slots of short connectors links until locking (1). The energy chains can be attached through four flange connectors (2).

The SD connectors are mounted like the links with the spreader (3) and provide universal connection options, as an example with Snap for fast and toolless assembly.

Strain Reliefs

With long travel distances and high speeds the lines at one end of the cable carrier, preferably on the moved driver, are attached to strain reliefs. The distance of strain relief to the bending area depends on the particulars of the line manufacturer.

Integrated strain relief

In this space-saving type strain reliefs are directly mounted on the vertical divider (PZ) of the first link of the energy chain.

The mounting direction of the PZ must be chosen so that tension directed on the chain can not unlock the divider.

In order to avoid premature line wear caused by dynamic loads a small extra chain length is recommended.

Combined strain relief

The combined strain relief combines the advantage of sufficient distance from the strain relief to the bending line areas provided by a simple and space-saving installation of the integrated strain relief.

The anchor profile is fitted to the drilling dimensions of the energy chain (integrated connectors) and attached to this. The lateral insertion and extraction of strain relief elements is possible at any time.

Separate strain relief

The separate strain relief is recommended for high dynamic loads and large line diameters. A sufficient distance from the strain relief to the chain is easy to implement.

PKK ASSEMBLY

ANCHOR PROFILE ZLP

The aluminum anchor profile is used to mount various of strain relief elements. Both the distance to the energy chain as well as the positioning of the strain relief elements can be designed.

STRAIN RELIEF STAY PZL

The design of this strain relief stay is closely based on the plastic vertical divider (PZ). It is laterally inserted into the anchor profile or a c-profile and can accommodate multiple strain relief elements.

BLUE RIBBON ZLB 24

The Blue Ribbon is a special ekd developed cable tie with a 24 mm wide fixing area for cable diameters of 7 mm to 35 mm. The Blue Ribbon can be locked on the strain relief stay. The lines may be fixed single or multiple (s-shaped) with the Blue Ribbon.

PUSH ANCHOR ZLS 10

The push anchor is laterally inserted into the anchor profile or a c-profile. The lines are fixed with standard cable ties on the push anchor.

CABLE ANCHOR ZLA 8

The cable anchor is pushed onto the strain relief stay and can be fixed by the latching at different altitudes. The line is connected with commercially available cable ties on the cable anchor (single or double).

HORN STAY ZHS 10

The horn stay ZHS10 is transversely inserted into the anchor profile and locked by a 90 ° rotation. The line is fixed with cable ties at the horn.

YOKE CLAMPS

Commercially yoke clamps can be used as a separate strain relief (see below) and can be mounted with the aluminum c-profile of the SLE 520, SLE 320 in front of the energy chain connectors.

Maintenance of the energy chain

PKK energy chains are maintenance free. Like every mechanical system there will - depending on the ambient conditions - wear must be observed.

In case of this the energy chain has to be replaced.

For long travels or even in a circular motion, the energy chains are often equipped with sliding elements. These allow sliding of the upper part of the chain on a suitable surface (eg, slider-slider, slider-steel, glide bar).

The sliders show wear according to the application due to abrasion. The slider surfaces should be checked at regular intervals on their condition. With a thickness of 1-2 mm sliders have to be replaced.

PKK parts 55

closed + open

PLE CHARACTERISTICS

The PLE with aluminum stays is available as **PLE** with plastic inserts or plastic slot profile, as **PLS** with foam slot profile or as **PLP** with plastic divider PZ.

- positive stay locking
- both inside and outside radius can be opened
- simple to shorten or lengthen
- stepless stay length up to 1000 mm

All ekd plastic energy chains are equipped with the **integrated connector**. Additional components for mounting the energy chain are not required.

Travel

The maximum travel is determined by the arrangement and the additional weight (line weight). At normal arrangement the maximum travel is twice the free carrying length. Support rollers or similar constructive steps can increase this value.

In gliding arrangements travel distances up to 100 meters are possible.

Longer travel distances need further constructive steps, like SYSTEM MARATHON, which exceeds the travel distance nearly without limits.

Travel speed

There are no limits for the travel speed in general. But in gliding applications specific influences have to be taken into account.

Acceleration

In principle there are no restrictions for the acceleration. Limits can only be achieved at high tension forces caused by high additional weights.

Temperature

The operating temperature is inbetween -20 °C and 100 °C.

Special versions

ALLROUND	... all movements
ATEX	... EX-protection
ESD	... antistatic
V-0	... self extinguishing

The usable interior width is stay length - 2 mm

type / radius x length / stay length / connectors / arrangement / stay distribution

PLE energy chains are distinguished from standard plastic chains by their extreme stability and the rigid, continuously adjustable aluminum profile. Stay lengths up to 1000 mm can be accommodated.

The allocation of the interior offers variable opportunities and guarantees optimum line protection even at high acceleration and travel speed.

The **PLE** (PLE with plastic inserts or plastic insert-profile) ensures a perfect guide at high speeds. Errors during installation of the cables are nearly impossible, with this variation, the hole design of the stays meet exactly the requirements of the lines. Plastic inserts are available in 5 mm steps. The plastic insert-profile can be ordered according to drawing.

In case of limited installation space, the **PLS** (PLE with foam insert-profile) are used. Again, the optimal guiding of the lines at high speeds and acceleration is ensured. All lines are in the neutral axis (middle of chain height).

For space reasons the **PLP** (PLE with plastic dividers) may be chosen. This inexpensive design allows secure guiding of large amounts of cable. The highly variable stay distribution opportunities through the small steps (3mm) in height and the infinitely adjustable plastic telescopic dividers (PT) allow maximum space for all needs, even when changes in cable diameters are required.

PLE 220, 320, 520, 620

The standard type is build with stays in every second chain link. The **integrated connector** makes every link in the chain when needed to a connector (*not 620*) and therefore the separate ordering and storage of end connector brackets is not necessary.

order example:

PLE 220	/ 100	x	3525	/ 100
type	radius		length	stay length

PLE 221, 321, 521, 541, 621

These designs are made with stays in each link. This increases the lateral stability and improves the guiding particularly of smaller diameter lines.

order example:

PLE 221	/ 100	x	3525	/ 100
type	radius		length	stay length

PLE 325, 525, 625

The closed types with aluminum covers may also replace the standard version stay. The covers can be opened in the inner or outer radius.

order example:

PLE 325	/ 300	x	3500	/ 100
type	radius		length	stay length

PLE 328, 528, 548

These types are suitable for long travel, the upper strand slides on the lower strand. For increased stability these energy chains are also build with stays in each link. The energy chains are fitted with sliders in the inner radius, which have a very low coefficient of friction ($\mu = 0.2$ to 0.25). After reaching the wear limit, the slider can be renewed and the energy chain will continue. Subsequent slider assembly is also possible. Then, the stays must be provided with drilled location holes.

order example:

PLE 328	/ 200	x	3500	/ 100
type	radius		length	stay length

10	outer cover

Lengthening or shortening, link bands

To shorten the spreaders are disengaged (1), taken from (2,3) and the corresponding piece of chain removed (4). Lengthening is done by adding links and inter-lock with the spreaders.

Alternatively, first part of strands assembled or dismantled. Then a stay assembly or disassembly is required.

Stay assembly

Stays are installed (1) and locked by horizontal shifting into place (2). Then pushing the sealing bars outside until they lock the link.

Stay disassembly

Push sealing bar to the inside (4), unlock stay (5) and remove them (6).

Filler

The fillers are mounted in the recess and (possibly with a light plastic hammer) pushed until locked (1).

The dismantling of the fillers is done with a screwdriver. The screwdriver blade ought to be small enough to start behind the filler. Then unhinge the filler (2).

Covers

The assembly of the covers is the same as the assembly and disassembly of the stays. The sealing bar is positioned in the designated position with a screwdriver.

Plastic inserts

The inserts are assembled according to the required lateral position (1) and inserted into the stay (2).

Foam

The foam insert is pushed laterally into the aluminum-profile (1), before they are assembled to the chain links.

Plastic divider PZ

The plastic dividers are hooked into the desired position with the long side of the foot in the aluminum bar and engaged with slight pressure (1).

Corrections of the position by lateral displacement are possible. The dismantling of the PZ is done by pulling in the opposite direction or sideways push out from the stay.

Telescopic horizontal divider

The telescopic horizontal divider can be adjusted in length (2), vertically fitted on the PZ (3) and engaged in the designated height.

The dismantling is carried out with a screwdriver by unlocking and removal.

Mounting the energy chain

All ekd plastic energy chains are equipped with **integrated connectors**. They allow the mounting of the energy chain with any link.

In gliding energy chain applications or for a smooth optical effect, the mounting holes in the fixed connector can be countersunk.

Face mounting

The energy chain PLE can be optionally fitted with flange connectors. The flange connectors allow various mounting opportunities, mounted like chain links and secured with a stay.

Sliders

To avoid damage the slider must be conditioned (overnight storage in water at room temperature or 2 h at 80 °C).

The slider is positioned at the inner radius of the energy chain, with the pin in the bore of the stay (1) and pushed until the snap hook locks (2).

To dismantle unhinge the snap hook (3) and remove the slider to the top (4).

The implementation of an energy chain with sliders has to be done smoothly. In addition, the glide bars (1) should be fitted with contour at the end of the energy chain and counter sinking the connector screws (2). The distance between the glide bar to the first slider should be less than the slider length (3).

Maintenance of the energy chain

PLE energy chains are maintenance free. Like every mechanical system this will depend on the ambient conditions so wear will occur which must be observed.

In case of the energy chain has to be replaced.

For long travels or in a circular motion, the energy chains are often equipped with sliding elements. These allow sliding of the upper part of the chain on a suitable surface (eg, slider-slider, slider-steel, glide bar).

The sliders wear depends on the application. The slider surfaces should be checked at regular intervals. With a thickness of 1-2 mm sliders have to be replaced.

SLE CHARACTERISTICS

The SLE is available as **SLA** with aluminium T- or slot-profile, as **SLE** with plastic inserts or plastic slot profile, as **SLS** with foam slot profile, as **SLP** with plastic divider PZ or as **SLR** with pipe or roll stays.

In steel, stainless steel and hardened material is the steel chain in case of large free carrying lengths, large quantities of cables and heavy-duty hydraulic hoses first choice.

stay distributions in many variants
stay fast assembly and disassembly
simple shortening and lengthening
shroud protecting pivot mechanics

Travel

The maximum travel distance is determined by the arrangement and the additional weight (line weight). At normal arrangement the maximum travel is twice the free carrying length. Support rollers or similar constructive steps can increase this value. In gliding arrangement travel distances up to 100 meters are possible (application dependent). Exceeding this value additional constructive action is needed (see design guidelines).

Travel speed

The standard and the stainless steel design is limited at 1m/s. Exceeding this and high dynamic loads caused by e.g. vibrations or high number of cycles require the use of the hardened (carburised) material.

Acceleration

The acceleration in principle is not limited. Limits are achieved, by very long chains and line weight that cause extreme tensile forces.

Temperature

The long term operating temperature is -20 °C to 600 °C (-40 °C stainless steel to 600 °C).

Special types

Stainless Steel
Carburised (hardened)

the usable interior width is stay length - 2(e-f)

SLE TYPES

SLE 120, 220, 320, 520, 620

The standard type is built with stays in every second chain link. The steel link energy chains can be opened in the inner and in the outer bending radius.

order example

SLP 120	/ 100	x 2050	/ 100	/ D	/ E	/ h	/ 2PZ
type	radius	length	stayw.	connect.	arran.	stay dist.	

SLE 121, 221, 321, 521, 621

These designs are made with stays in each link. This increases the lateral stability and improves the guiding particularly of smaller diameter lines.

order example

SLP 321	/ 100 x 3100	/ 200	/ N	/ N	/ n	/ 5PZ, 3PT
type	radius length	stayw.	connect.	arran.	stay dist.	

SLE 225, 325, 525, 625

The closed types offer optimum protection of the lines against dust and cuts or other environmental influences. At higher temperatures the covers **Silver Star** provide excellent protection.

The closed types also may be built to replace the standard version stay.

order example

SLP 225	/ 200 x 2550	/ 150	/ N	/ N
type	radius length	stayw.	connectors	

SLE 128, 228, 328, 528, 628

These types are suitable for long travel, the upper strand slides on the lower strand. For greater stability these energy chains are built with stays in each link. The energy chains are fitted with sliders, which have a very low coefficient of friction ($\mu = 0.2$ to 0.25).

After reaching the wear limit the slider can be renewed and the energy chain will continue.

order example

SLP 328	/ 200 x 45000	/ 250	/ N	/ N	/ g	/ 3PZ
type	radius length	stayw.	connect.	arran.	stay dist.	

Compared to standard chains the SLE series is characterized by the fact that the sturdy aluminium profile can be steplessly adapted to the requirements. Stay lengths of up to 1500 mm can be provided. The subdivision of the interior satisfies every requirement and guarantees optimized cable protection, even at very high accelerations and travel speeds.

The **SLA** (SLE with aluminum T-profile or aluminium slot-profile) is a highly customized and robust energy chain, which is chosen primarily for larger dimensions. The stays are milled in accordance with the requirements of the user with individual hole patterns.

For extreme applications, the variants **SLA**, **SLS** and **SLE** should be preferred, since these offer optimize cable guiding. In the case of high speed and acceleration a multi-layer arrangement of the cable should be avoided.

The **SLE** (SLE with plastic inserts or plastic slot-profile) ensures at high speeds a perfect guide and almost excludes errors during installation of the lines. With this design the hole pattern of the stays can be adjusted accurately to the needs of the lines. Plastic inserts are available in a 5 mm grid. The plastic slot-profile can be ordered to suit special requirements.

For limited installation space, the **SLS** (SLE with foam slot-profile) are used. Again, the optimal guiding of the lines at high speeds and acceleration is ensured. Well-known automotive manufacturers have used this type for years with the best experiences. All lines lie in the neutral axis of the energy chain.

For space reasons, the **SLP** (SLE with plastic divider PZ and others) can be selected. This inexpensive design allows the guiding of large amounts of cable. The highly variable distribution possibility through small steps of (3mm) in height, plus the Telescopic divider (PT) allows maximum space for all needs, even when changes in cable diametres are required.

The **SLR** (SLE with a pipe or roll stays) is manufactured only upon request. The pipe stay allows special material combinations, such as the exclusion of aluminum or the use of stainless steel and brass. The roll bar has advantages particularly for heavy lines with high friction and wear in terms of durability of the cables and hoses: Relative movements on the energy chain are compensated by the rolling motion of the stays.

The use of steel chains with steel bands (16) is limited to energy chains with a maximum length of 6 m and stay length of 600 mm. For reasons of rigidity longer energy chains have to be build by using the **silver star** covers.

A later equipment with steel bands is not possible. Steel bands have to be listet in the order of the energy chain (see page 92 bottom).

Packaging

ekd energy chains are supplied in secured device packaging. When removing the packaging and moving the energy chains or parts of them, ensure that the energy chains are free of torsion and tension to avoid mechanical damage.

Lengthening or shortening

If energy chains are delivered in pieces, proceed with the installation as follows:

Push the link together (1) and insert the flange bolts (5) with a shroud (7) in the chain outside. Then build the radius by inserting the radius bolts (6) (see chart for correct radius). Finally put on the inner shroud (7) and fit the retaining ring (8). Roll the energy chain to check that the radius is correct throughout its length.

Shortening in the reverse order:

Loosen the retaining rings (8), pull out the flange bolts (5), lifting the shroud (7), pull the radius bolts (6) and remove the links (1).

Energy chains with threaded bolts instead of the retaining rings (8), first unlock the locking plates (18) to solve the locknuts (19). Thereafter, the threaded bolts (17) and pins (6) can be removed and taken from the links (1).

Implement the connector angle

The connector angles (4) are orientated to the outer radius and to the chain center (normal end mounted). By loosening the retaining rings (8), drag the flange bolts (5), lift off the shroud (7) and pull the radius bolts (6) the connector angles (4) can be disassembled and placed in a different position.

Bending radius

Loosen the retaining rings (1) and lift off the shrouds (7). Implement the radius bolts (6) according to table (page 89). Then mounting the shrouds (7) and retaining Rings (1).

The detachable bolts position for the different radii can be found engraved on the double connector links (3).

assembly of radius bolts

SLE	120	220	320	520	620	
radius	60	100	150	200	250	 <p>(marking in the outer radius)</p> <p>the minimum radius is built with only 2 bolts</p>
radius	100	150	200	250	300	 <p>(marking in the outer radius)</p>
radius	150	200	250	300	400	 <p>(marking in the outer radius)</p>
radius	250	250	300	400	500	 <p>(marking in the inner radius)</p>
radius	-	300	400	500	600	 <p>(marking in the inner radius)</p>

Stay removal

The stays (9) are fastened with serrated screws (10) to the links (1). They can be removed by unscrewing the four screws (10). Stay lengths up to 600 mm are available with quick assembly.

Quick assembly

In quick assembly only two screws must be tightened or loosened. The stays (9) are moved with the groove on the rivet and the serrated screw (10) snapped in the recess and tightened.

Cover Silver Star

The covers of the closed version can be removed like the stays by loosening the four serrated screws (10). The spacers (13) remain on the links.

Stainless steel bands

To protect the lines against external damage and pollution the chains can be equipped with steel or stainless steel bands in the inner and outer radius. The edges of the steel bands are circular smoothed to avoid injury. Stainless steel and steel bands are fastened with band holders screwed on sides and with screwed connections on each end of the chain.

Final assembly

The installation height should not fall below the level $H = (50 \text{ plus two times bend radius plus link height})$.
 The pretension of cable carrier is taken into account with the additional space of 50 mm.

First fasten fixed connection (F) and then mount the movable connection using the specified bolt size (see SLE connectors).

Compliance with the maximum free carrying length is of vital importance for the life time of the energy chain, both during the installation as well as when operational. Over travel of the energy chain can lead to damage and premature wear.

If the energy chain is provided with support elements, the assembly of these must take place before the installation of the chain in order to avoid even a short-term stress point.

An energy chain may never exceed the free carrying length without support rollers.

The height of the moved connector must be adjusted so that the connector link is moving with a maximum of 5 mm distance from the base of the supporting roller.

Maintenance of the energy chain

PLE energy chains are maintenance free. Like every mechanical system this will depend on the ambient conditions so wear will occur which must be observed.

In case of the energy chain has to be exchanged.

For long travels or in a circular motion, the energy chains are often equipped with sliding elements. These allow sliding of the upper part of the chain on a suitable surface (eg, slider-slider, slider-steel, glide bar).

The sliders wear depends on the application. The slider surfaces should be checked at regular intervals. With a thickness of 1-2 mm sliders have to be replaced.

Support brackets and support rollers

Support rollers are used when half of the travel exceeds the free carrying length ($L_v > 2LF$).

Support rollers allow four times extension of travel distance (see design guidelines).

The order of support rollers SR with support brackets for SLE (roller Ø100 for all sizes) contains the following information:

SR width of support [cm] / Ø 100 x height of bracket

The **width of the support (A)** depends on the width of the energy chain:

The dimension A is to be calculated with the chain outer width in mm and round up to cm:

$$A = \text{staylength} + 2f + 20$$

The height (H) of the support depends on the bending radius of the used energy chain: $H = 2R - \text{max. 5mm}$

For example: SLE 320 dim. f=11, bend radius 200 mm
stay length 215 mm:

$$215 + 2 \times 11 + 20 = 257 \Rightarrow A = 26$$

SR 26 / Ø 100 x 400

The steel support rollers are delivered with robust high-quality support frames.

The height of the moved connector must be adjusted with a maximum 5mm distance from the base of the supporting roll.

As an alternative to steel rollers SR, plastic support rollers PR for plastic chains are available.

Flange rollers

The flange rollers are used for very long chains in combination with a support railing with supporting rollers and support frames (see design guidelines).

Guide rollers for steel chains

Guide rollers are used for steel chains in arrangement u (moving end downside, see arrangements). In this case provide a trough or a corresponding support rail.

	v
SL 220	44
SL 320	46
SL 520	50
SL 620	50

Gliding discs for steel chains

For the SLE in arrangement w (lying horizontally on the side) for the longest travel distance or in arrangement k (circular) gliding discs are used. The gliding discs are made of high quality, highly abrasion-resistant materials. In both arrangements a guide is necessary.

Shelf troughs for steel chains

Shelf troughs consist of two standard angular channels that are welded together from 3m lengths. Shelf troughs will be used if a smooth and precise guidance of steel chains is necessary.

Important for the assembly: Weld angular channels smooth and without any offset and clean the weld seams. In the entire shelf area no projections or obstructions may be present (eg, screw heads, nuts,).

Support carriage for steel chains

Steel chains with support carriage are used for long travel distances and very high additional weights in a counter-chain arrangement. With side-mounted guide rollers the energy chains are supported on the support carriage.

Technical Features: No push - just pull-tension, large travel distances, extreme additional loads, smooth running, long life.

GKA

GKA dimensions	102
GKA connectors	103
GKA types	103
GKA sizes	104
GKA parts	105

application range

GKA characteristics

The GKA is characterized by the highest stability compared to standard chains, with almost unlimited dimensions and the choice of material.

The interior is custom formed and thus guarantees an optimal cable guiding.

Stay lengths up to 1200 mm are possible.

The bending radius can be created according to customer specifications if required.

Dimensions

bend radius:	200	to	... mm
inner height:	118	to	468 mm
inner width:	100	to	1172 mm
energy chain weight:	25	to	85 kg/m

Travel

The maximum travel distance is determined by the arrangement and the additional weight (line weight). At normal arrangement maximum travel is double the chain length minus the arc of the chain radius. Support rollers or similar constructive steps can increase this value.

Travel speed

The standard and the stainless steel type are limited at 1 m / s. Exceeding this and high dynamic loads caused by eg vibrations need the use of carburated material.

Acceleration

The acceleration in principle is not limited. However limits may exist if very long chains and line weights cause extreme tensile forces.

Service temperature

The operating temperature is -20 ° C up to 600 ° C (stainless steel -40 ° C up to 600 ° C).

GKA with aluminum profile

A highly customized and robust design that is used mainly in larger steel chains. The stays are created according to the specifications of the user:

steel plant: GKA 161

GKR with rods

Made of stainless steel this energy chain is generally offered for off-shore, since aluminum is not suitable for these applications. The chains can be separated into different sections by additional stainless steel dividers:

water power plant: GKR 260

GKP with plastic dividers

These stays can be especially used for heavy mechanical engineering. The advantages in comparison to the GKA (aluminum profile) are in the price, the weight and space savings.

mechanical engineering: GKP

GKA	bending radius	Tlg. pitch	a	c	o	p	weight ¹⁾ kg/m
110	as specified (>200)	175	118	150	230	110	25

410	as specified (>600)	475	418	450	620	410	75
460	as specified (>700)	525	468	500	680	460	85

¹⁾weight for stay length 500

The bending radius is freely chosen after consultation. It is advantageous to adjust the bending radius of the chain to achieve a minimal polygon effect.

Stay lengths are available in steps of 1 mm.

The usable interior width is stay length minus 14 mm

Stay types and connectors may vary from those representations. Energy chains GKA are custom made in consultation with the client, usually from drawing. Item numbers are not given for this reason.

For energy chains type GKA choose the order length as an uneven multiple of the pitch.

order example: max. travel distance 20,9 m, bend radius 800 mm, normal constellation

32 S	300	109	109	115	115	80	30,5	141	175	6.6

The order of length is equal to half the length of travel, plus four times bending radius:

$$L = L_v / 2 + 4 R$$

order example: max. travel distance 3 m, bending radius 100 mm, standard arrangement

SFK 32N / 200	x	1900	/	N/N
type / radius	x	length	/	connectors / arrangement

SFK Characteristics

The chain consists of a rectangular, galvanized steel spiral band and mounted in inner radius is a spring steel band. The SFK offers large usable cross-sections at low external dimensions and optimum line protection. At low cantilever lengths the SFK is ideal for areas with hot chips and sparks.

The temperature range is between -40°C and $+180^{\circ}\text{C}$.

SFK Flanges

Flange N

Standard is the low priced flange N, each with four mounting holes.

order example

SFK 32N	/ 250	x	3000	/ NN	/ h
type	/ radius	x	length	/ flange	/ arrangement

Flange A

With countersunk screws, knurled nuts and angles the standard flange N changes to flange A.

order example

SFK 32N	/ 250	x	3000	/ AA	/ h
type	/ radius	x	length	/ flange	/ arrangement

Flange B

Flange B is connected laterally with angles. The holes of standard flanges N are omitted.

order example

SFK 32N	/ 250	x	3000	/ BB	/ h
type	/ radius	x	length	/ flange	/ arrangement

Scoop mount

Scoop mount complements the diversity of the possible connector types.

Dismantling PFR

The pins (3x12mm) of the dismantling tools are inserted into the provided openings, dismantling tools compress and pull apart the carrier.

order example:			travel 3 m, bend radius 200 mm, plastic connectors, arrangement hanging			
PFR 222 / 200	x	2300	/	K K	/	h
type / radius	x	length	/	connectors	/	arrangement

PFR characteristics

The plastic tube PFR is a closed design with excellent protection from dirt and damage caused by chips or the like. In the types PFR 123, 223 and 323 the cables are kept in two separate chambers.

PFR with metallic finish is a ekd specialty that mainly occurs in applications with hot chips and sparks. Due to the high surface temperature conductivity and scratch resistance there are no limits for this surface coating. In addition this type has an exceptionally high quality look with the shiny metallic surface.

PFR with metallic surface are deliverable only on request.

Plastic connector PFR

The plastic end connector can be installed at any point in the chain, whereby a portion of the tube can serve as a static line.

Order example: plastic connector on both sides

PFR 121 / 75 x 1505 / KK
type / radius x length / connectors

Headside flange connector PFR

The headside bracket is used for assembly on top or front of the machine. A combination of frontal and end connection is possible.

Order example: plastic connector and headside flange

PFR 121 / 75 x 1505 / KSFA
type / radius x length / connectors

Normal flange (steel) brackets

Normal flanges made of steel can be supplied on request.

Ordering example: N flange and flange A

PFR 121 / 75 x 1505 / NA
type / radius x length / connectors

Guide troughs are necessary when a suitable surface for the unrolling of the energy chain is not present and to give guidance and support throughout the chain length.

gliding arrangement

The designing and assembling of the filing and guide channels should be handled with great care, because this is the only chance for a smooth operation of the system. ekd gelenkrohr manufactures troughs for all applications made of steel (galvanized), stainless steel or aluminum. The individual channel segments are mounted with connecting elements.

Trough for steel chains

Troughs for steel chains are made of edged groove angles that are bolted directly on the floor or on the corresponding substructures.

Steel-trough

The steel-trough is universally applicable. Besides the standard channel steel troughs (galvanized). Special dimensions and stainless steel guide troughs are available.

A simple on-site assembly is guaranteed by the top-hat profiles on which the trough segments can be accurately aligned. For this first preassembly the connection angle is finger tight then screw on the angles with the welded inserts. Then the groove is aligned and the connection angle can be fixed.

For gliding applications the angles are supplied with mounted slide bars.

2) connection angles 40 / 80 / 120 / 160 / 200
3m standard height 200

Aluminum trough

The aluminum trough (trough height 120mm) is perfectly adapted to floor assembly for long travels with energy chains of the type Kolibri.

Constructed with 3 m long channel segments, the width corresponds to the chain size, a fast and easy installation is performed. The connection of the single channel segments is with center bolts.

The first half of travel is fitted with gliding bars so that a smooth transition at the fixed connector (usually mid-travel) is guaranteed.

1) example arrangement. Other energy chains can also be used with corresponding outside dimensions.
2) Outside dimensions of the energy chain

Gliding arrangements

For travels up to about 60 meters, speeds of $v_{\max} = 1.5 \text{ m/s}$ and accelerations of $a_{\max} = 1 \text{ m/s}^2$ energy chains and troughs can be used.

Exceeding these values contact ekd gelenkrohr when planning your application.

The upper part of the chain runs up to half of the travel on slide bars that are bolted to the channel segments.

For long travels and heavy chains a lower connector assembling is required to guide driver initiated forces in the energy chain direction. A reduction to the height of the chain radius is usually sufficient.

The fixed connector area is designed to ensure a smooth transition of the energy chain. In addition, the slide bars in the end zone are contour adjusted. The energy chain can be attached separately with a countersunk screw or be mounted together with the slide bar. In addition, the glide bar must be be provided with a corresponding reduction.

Lower connectors need an additional chain length:

Not to burden the energy chain in the end position some (according to the application) chain links have to be fitted with an reverse bending radius, so that the driver stops at a sufficient distance in front of the chain bow end.

ENERGY CHAIN SYSTEMS are called components, modules or complete items ready for connection.

ekd energy chain systems are offered as a service package with all necessary planning and realization steps through to testing and production release.

This usually begins with the definition of the requirements in the travel distance, number of cycles other factors, such as environmental conditions and media influences and the available design space. From this data the amount and type of cables, their connections and the energy chain can be specified.

Cables

ekd gelenkrohr as a system supplier cooperates with all leading cable manufacturers. According to customer specifications ekd can work out an efficient and price-optimized solution in the system - whether power, bus, hybrid, or special cables with or without connectors.

The same applies to hydraulic lines. Standards and standard components are scheduled as early as the design phase, as well functional as cost-optimized.

Energy chains

The selection and design of an optimized energy chain or where the application requires a custom-tailored solution is based on decades of experience.

System

With the creation of individual strain relief systems, guide rails, troughs and enclosures the projects are completed to ready-assembly systems - including accompanying documentation.

Transit, maintenance and service

The complete assembly is shipped or after consultation with customer be installed by experienced ekd assemblers on site. Maintenance and service remains in the hands of customer or can be arranged individually.

The result is a flat rate for the energy guiding system, which frees the user of logistics, efforts and cost overruns.

applications:

cranes, reeling systems, handling equipment

example train wash:
free weathering
extreme influence of media (detergents)
travel 180 m

The SYSTEM MARATHON is designed for long travel distances with a rolling-led energy chain.

The upper part of the chain runs with roller sets on a continuous flat guiding rail surface. This construction avoids completely the sliding friction between the upper and lower strand of conventional energy chains. In this movement only substantially lower rolling friction occurs.

In front of the chain radius the roller sets are lifted out of the guide rail. In the chain radius the roller sets are pivoted into the trough by means of polygonal shape and the chain is lowered in the trough.

In the opposite direction of travel the roller sets behind the chain radius swirl again, embrace the guide rail and carry the upper strand centered within the trough.

Measurements for the SYSTEM MARATHON confirmed that the reduction of friction forces is up to 90%. Increased starting torque, as with sliding applications and the overcoming of static friction after a stop will not appear with this system.

Not least of all SYSTEM MARATHON minimizes wear through the rolling friction.

Another advantage is the parallel to the chain running force of the movable driver and the straight arrangement of the upper run which totally avoids changing bending of the lines and the energy chain. A substantially increased durability and reliability are the result.

example greenhouse:
relative humidity 80-100%
travel 150 m

conventional sliding application

SYSTEM MARATHON

1 of force not in energy chain direction
high-flexing of the energy chain
repeated bending of the lines

2 sliding friction: high forces
high starting torque
abrasion, wear, noise

3 bending of the energy chain and
the lines

4 oscillations lead to extreme
loads of the energy chain
additional lengths often necessary

SYSTEM MARATHON

moving forces reduced by up to 90%
forces into the direction of energy chain
no repeated bending
no increased starting torques
abrasion and wear-minimizing

Standard energy chains do not allow lateral displacements or torsion movements. They are made of rigid material with the set on maximum unsupported length and show a straight, hard running. The energy chains SYSTEM ALLROUND open new opportunities.

By using a highly flexible link-material (thermoset elastomer) offers SYSTEM ALLROUND countless exercise options without additional design efforts.

The high flexibility of the SYSTEM ALLROUND makes the combination of several movements. The combination of two linear motion is a possible.

Just as well combined rotary or oscillating movements may overlap to simple linear movements. Thus, if there is sufficient chain length, lateral pivoting movements of 90 ° and axial rotation of 180 ° are achieved.

An almost limitless range of motion is given in a hanging arrangement at sufficient chain length.

Practical examples demonstrate the versatility of the SYSTEMALLROUND:

ALLROUND	bend radius R	pitch	a	c	f	g	stay length [mm]
PKK 210	65 75 100 125 150 200 300	65	34	50	10	10	50...200 (see PKK)
PKK 240	75 100 150 200 300	65	44	60	10	10	50...200 (see PKK)
PKK 310	100 130 150 200 300 400	90	51	75	12	12	50...300 (see PKK)
PKK 340	100 130 150 200 300 400	90	60	85	12	15	50...300 (see PKK)
PKK 520	150 200 300 400 500	115	80	104	20	14	50...300 (see PKK)

The connector links of the SYSTEM ALLROUND are manufactured in the standard material PA 6 GF 35. A combination of standard links and ALLROUND links achieve applications with specific features are available on request.

order examplel:

PKK 220 / 200 x 3510 / 100 ALLROUND

type radius X length / stay variant

SYSTEM ELTOLA

ELastic TOrsion LA bearing is the combination of noiseless and low wear. The elastic torsion bearing replaces the conventional chains existing sliding pivot with a friction free connection. The relative movement between adjacent links is guided over the elastic torsion bearing.

In the angular motion is through this design with ELTOLA a torque transferred between the adjacent chain links, which increases starting from the neutral zero position with increasing twist angle. As a result a progressive damping of the polygon movement and a low noise, extremely quiet running is achieved.

All ekd plastic chains may be equipped with the SYSTEM ELTOLA.

ELTOLA is designed for applications with fast and noise-sensitive and large acceleration movements.

order example:

PKK 220 / 200 x 3510 / 100 ELTOLA

ELTOLA

SYSTEM REINTEC

The principle of the energy chain **REINTEC** is the avoidance of friction at the links and pins of conventional chains through a friction free connection:

The relative movement between the chain links is guided over the torsion bearing **ELTOLA** that positively connects links and is made of a special material. The links are spaced apart, thus preventing wear and abrasion.

REINTEC has significant advantages in comparison to known energy chains:

- abrasion and wear are optimized while maintaining the stability equal to standard cable chain

- quiet running through progressive torsion force

applications:

chip technology, food and textiles, painting and others.

IPA-Qualifizierungsurkunde

Hiermit wird bescheinigt, daß für untenstehendes Produkt des Unternehmens

ekd gelenkrohr GmbH

Steinbof 47
D-40699 Eilath

das IPA-Qualifizierungsiegel mit der Bericht-Nummer EG 0111-250 vergeben wurde.

Die Energieführungskette der ekd gelenkrohr GmbH des Typs „Reintec“ ist bei den Verfahrensgeschwindigkeiten $v=0.2$ m/s, $v=0.6$ m/s, $v_0=1.4$ m/s und $v=2.8$ m/s geeignet, um in Reibräumen der Luftreinheitsklasse „Class T“ (nach US Federal Standard 209F) eingesetzt zu werden.

Detaillierte Informationen sowie die Parameter der Umgebung entnehmen Sie bitte dem IPA-Bericht der Fraunhofer-Gesellschaft.

Bescheinigt am 21. November 2001.

Die zeitliche Gültigkeit dieser Bescheinigung ist unbegrenzt.

source: Fraunhofer Institut Produktionstechnik und Automatisierung (Fraunhofer IPA), Stuttgart, 2008

ekd energy chains are made from high quality materials according to ekd specified material minimum values. Continuous Inspection of incoming and outgoing goods in connection with the requirements of the ISO 9001 quality management system guarantee a consistently high reliability.

Environmental aspects are taken into account by complying with specified regulations for the selection of materials and manufacturing processes (RoHS directive 2002/95/EC, directive 2006/122/EC PFOS, RL 1907/2006/EC REACH).

Furthermore there are negative listings (absence lists) for environmentally hazardous substances to prevent bring in the market of so-called problem substances.

STEEL galvanized

STEEL hardened
carburated

STAINLESS STEEL

Energy chains made of steel

Galvanized steel

ekd energy chains are made of high strength steel with a minimum tensile strength of 560 N/mm^2 ($R_m > 560 \text{ N/mm}^2$) and standard electroplated galvanized.

Stays and covers (**silver star**) consist of a seawater-resistant aluminum alloy (Al Mg Si 0.5).

Steel hardened (carburated)

Steel chains with high dynamic loads (eg when traversing over 1 m/s) are manufactured in hardened version. Through the special surface hardening process a very good wear resistance combined with high toughness of the energy chain is reached. This also results in an excellent and free of pollutants corrosion protection. Specially in the case of high cycle numbers hardened (carburated) links lead to longer life times.

Visual differences between the chains of the galvanized steel chains is a dark, pale appearance of the links. In this version, stainless steel screws and bolts should be used, too. The retaining rings are made of a bronze alloy.

Stainless steel

For extreme demands on corrosion resistance (eg, sea water resistance) this energy chains are made of a suitable stainless steel.

Energy chains made of steel and stainless steel are suitable for operating temperatures from -40°C to 400°C .

Plastic energy chains

ekd plastic energy chains are manufactured from high quality polyamide. In addition the series PLE with stays of seawater resistant aluminum and chains made of the plastic Kolibri and PKK are in the product range.

The standard material is polyamide 6 reinforced with 35% glass fibres (PA 6 GF 35). The continuous service temperature range for energy chains made of this material is -20 ° C to 100 ° C. Outside these limits a significant decrease in the mechanical strength characteristics must be expected. A detailed design is then essential.

The resistance to environmental influences is generally very good except for concentrated acids and bases, see chapter chemical resistance. Depending on the order, polyolefins can be used that provide chemical resistance in a wide range of applications.

For special applications, the material is modified:

High impact (HI), food applications (FDO), flame retardant (V-0), for explosion-endangered areas (EX) or against electrostatic discharges (ESD).

To optimize the flexibility energy chains they are manufactured from non-reinforced polyamide 6 and polyamide 66, and thermoplastic elastomers (SYSTEM ALLROUND).

With a combination of special construction and material properties in particular for clean room applications excellent technical results are achieved (SYSTEM REINTEC).

All components of the plastic energy chains are made of thermoplastic materials that are recyclable.

Plastic energy chains are suitable for operating temperatures from -20 ° C to 100 ° C.

The following list of substances and compounds are reference values for the resistance of polyamides. Polyamides are generally resistant to aliphatic and aromatic hydrocarbons (eg, fuel), fats and oils and to many organic solvents. Polyamides are not resistant to organic and inorganic acids, some even in low concentrations, as well as to strong oxidizing agents. Fittings made of polyamide are generally regarded as stress crack resistance.

calcium hypochlorite	chloramines	chlorine	hydrochloric	acetic acid (30%)
hydrofluoric	hydrofluoric acid (40%)	iodine	iodide	perchlorate (2%)
potassium	permanganate (10%)	solder liquid	sodium hypochlorite	20 ppm of ozone
nitric acid	perchloric acid (1%)	hydrochloric acid (1%)	oxygen	sulfuric acid(10%)
thionyl chloride	trichloroacetic	trichloroethyl hydrogen peroxide (10%)		cinnamaldehyde
Zinc halides (aqueous)				

soluble

formic acid (85%)	calcium chloride	aniline	alcohol. Chloral hydrate	
dimethylformamide	ethylene glycol	dimethyl	phenol	cresols
hydrochloric acid conc.	sulfuric acid (96%)			

About this catalogue

Descriptions and technical informations which are shown in this catalog are purely informative and provide only the general Information. An assurance of properties for certain applications is denied. The catalog reflects the technical state of the art at the time of the edition. Changes to the products remain at any time. The in the order and contract agreed properties of the product is binding.

All copyrights of all texts and illustrations in this catalog are ekd-gelenkrohr GmbH owned. Copies of whatever kind and disclosure to third parties requires the express consent of ekd-gelenkrohr GmbH.

General operating and safety instructions

Energy chains are technical products, which are constructed as part of an engineering-design for concrete applications according to the state of the art. In dealing with these products the compliance to the operating and safety instructions and general rules of technology is assumed.

Thus, for example, the stay in the work area of an energy chain is only allowed if adequate safeguards are in place to prevent accidental moving of the chain. The accident prevention regulations are strictly to be observed. Further requirements, such as when operating in explosive hazardous areas are - if applicable - to take into account as well.

The intended use has to be in compliance with the design limits of energy chains. The below known from practical experience can lead to considerable functional errors or damage of the energy chain :

- improper handling of the energy chain during transport and assembly
- undue weight load of the energy chain, especially of a free carrying upper strand of the chain
- operating the energy chain out of the limits of the designed travel distance
- introduction of interference contours, components or parts thereof into the operating area
- improper line load

Are the operating conditions such as wear-boundary conditions of abrasive dust entry or plant-vibration and oscillations can not be avoided, so by appropriate constructive steps and inspection intervals, particularly in unsupervised, automated operating systems, unforeseen equipment failures have to be avoid.
