

VIBRATION DAMPERS

Highly elastic and tearproof mounts for passive and active vibration dampening

- Vibration-free mounting of motor test stands, emergency generators, compressors, etc.
- Tearproof mounting of suspended loads such as crane tracks and cable car cabins
- Anti-vibration machine leveling feet with balancing ball joints
- Impact-resistant vibration dampers for energy dissipation at belt transfer stations
- Standardised product range for high load capacities

Product advantages:

high degree
of isolation

tearproof

maintenance-free

Selection table vibration dampers

	Illustration	Type	Description	Page
Vibration dampers basic types		ESL	Vibration dampers for the absorption of tensile, pressure and shear load. Also ideal for wall and ceiling installations. 8 element sizes from 200 N to 19 000 N. Natural frequency between 3.5–8 Hz. Mounts are mainly used for overcritical machine installations (machine frequency > mount frequency).	4.3
		AWI	Vibration dampers for to absorb tensile and pressure loads. 7 element sizes from 180 N to 16 000 N. Natural frequency between 3–7 Hz. Mounts are mainly used for overcritical machine installations (machine frequency > mount frequency).	4.4
		V	Vibration dampers for the absorption of tensile, pressure and shear load. Also ideal for wall and ceiling installations. 6 element sizes from 300 N to 12 000 N. Natural frequency between 10–30 Hz. Mounts can be used for subcritical machine installations (machine frequency < mount frequency).	4.5
Vibration dampers additional types		N	Mounting feet consisting of insulating plate, top cover with built-in levelling jack-screw with spherical joint for compensation of up to 10° of floor unevenness. Insulating plate oil- and acid-proof. FDA approved. 3 element sizes from 3 500 N to 20 000 N. Natural frequency between 19–27 Hz.	4.6
		NOX	Mounting feet consisting of insulating plate, stainless steel top cover with built-in stainless levelling jackscrew with spherical joint to compensate of up to 10° of floor unevenness. Insulating plate oil- and acid-proof. FDA approved. 2 element sizes from 5 000 N to 20 000 N. Natural frequency between 19–24 Hz.	
		Base plate P	Accessories for N and NOX for high shear forces or for assembling on a base or frame. The base plate must be bolted to the floor.	4.7
		M	Mounting feet consisting of metallic insulating cushion. Cushion resistant against corrosion, greases and solvents. 6 element sizes from 300 N to 35 000 N. Natural frequency between 14–26 Hz.	4.8
		NE	Adhesive cushioning plates made of closed-cell polyether urethane, no water absorption and good oil resistance. 3 element sizes from 500 N to 130 000 N. Natural frequency between 14–25 Hz.	4.9

* compression load $G_{max.}$ and cold flow compensation (after approx. 1 year).

If no other units are specified, the numbers given are in mm.

The sizes 50 to 50-2 can be combined with one another (identical heights and operation behaviour).

The max. load on X-axis should not exceed 200 % of the Z-axis capacity.

The max. load on Y-axis should not exceed 20 % of the Z-axis capacity.

Applicable on tensile, pressure and shear load.

If no other units are specified, the numbers given are in mm.

Insulates structure-borne noise.
 Chrome-steel cushion temperature resistant –40 °C to + 250 °C.
 Resistant against corrosion, greases and solvents.
 Up to 3 g dynamic shock loading permissible.
 Unlimited lifetime.

On request available stainless steel anti-slip soles with granules on the underside:
 – Part no. 04 020 451 for M 43 M16 and M 43W M16
 – Part no. 04 020 452 for M 44 M16 and M 44W M16
 – Part no. 04 020 453 for M 45 M20 and M 45W M20

Vibration damper

If no other units are specified, the numbers given are in mm.

Tolerances according to ISO3302-1:1999 class L3 and EC3. The deflection of the cushions by the mentioned max. catalogue load capacities is 1.4 mm.

VIBRATION DAMPERS

Vibration dampers

Isolation of oscillations and shocks

Manufacturers of vibration dampers usually offer different designs of machine mounts with varying natural frequencies, to meet the required detuning between the excitation frequency of the machine to be mounted and the natural frequency of the damper.

The vibration technology basically differentiates between two different oscillation patterns. Oscillations are usually eradicated with supercritical designed machine mounts, while shocks are eradicated with subcritical ones.

Frequency proportion λ

- $\lambda > \sqrt{2}$: Overcritical: vibration isolation, definable effectiveness W , and efficient structure-borne sound insulation
- $\lambda = 1$: Resonance range: amplified resonance, maximum values depend on the internal insulation D within the resonance range
- $\lambda < 1$: Subcritical: no definable vibration isolation and lower structure-borne sound insulation

Vibration dampers

Overcritical installations ($\lambda > \sqrt{2}$)

For overcritical mounts, the natural frequency values of the mounts must be at least $\sqrt{2}$ below the excitation frequencies of the machine or unit. As a rule, a damper with a relatively large spring deflection performance under load is selected. Most units, compressors, motors, blowers and generators are mounted overcritical making them relatively «soft». The resulting frequency ratio provides information about the expected isolation effectiveness of the mount. The line scale opposite and the calculation give the expected insulation W as a %.

$$W = 100 - \frac{100}{\left(\frac{n_s}{60 \cdot f_e}\right)^2 - 1} [\%]$$

n_s =
Revolution exciter
(machine) [rpm]

f_e =
Natural frequency damper
[Hz]

Subcritical installations ($\lambda < 1$) and resonance range ($\lambda = 1$)

Subcritical installations

A damper with high mechanical strength and low deflection behaviour (high mounting stability) is usually used on subcritical mounts. With this type of mounting, it is possible to damp impacts and shocks from relatively slow-moving machines such as mixers, crushers (cone crushers), punching presses, shears, etc. On machines with subcritical mounts, the resulting efficacy of the isolation insulation cannot be calculated – it can only be determined by comparing the values before and after.

Resonance range

Any coincidence between the exciter frequency and the natural frequency of the damper lead to an undesired, uncontrollable swinging up of the machine to be stored.

Vibration dampers

ESL: Deflection curves and setting behaviour

The deflection graphs already contain an initial cold flow that occurs after the first hours of operation. The final cold flow is approx. $s \times 1.09$. These deflection values are based on our catalogue data and are to be taken as guidelines. Please also refer to our tolerance data in chapter 7 «Technology – ROSTA Basics».

ESL: Installation guidelines

The ESL elements must generally be installed in the same direction.

Dynamic forces longitudinal

Dynamic forces lateral

ESL 50-2	1 250 Nm

Transfer stations equipped with ROSTA Type ESL vibration dampers offer a progressive deflection characteristic that effectively dampens the kinetic energy created when the falling material makes impact. This protects the surface of the belt's coating from cracking, dramatically reduces the level of continuous material wear and protects the substructure from premature failure.

These deflection values are based on our catalogue data and are to be taken as guidelines. Please also refer to our tolerance data in chapter 7 «Technology – ROSTA Basics».

V: Installation guidelines

The V elements installed in the same direction hold load to G_{max} in X- and Z-direction.

Dynamic forces longitudinal

Dynamic forces lateral

45° diagonal configuration by rotary motions. Reduced load capacities.

Vibration dampers

NE: Maximum load and options

Maximum load sizes NE 50-12 to 400-12:

Options on request:

- Adhesive layer
- Different length and width, maximum dimensions are 1.5×5 m.
- Material thickness of 8, 12.5 and 25 mm; multiple thickness 37.5 and 50 mm.
