

INTERNAL MEDICINE

OVERVIEW

At Pacific Northwest Pet ER & Specialty Center, our internal medicine specialists care for patients with a variety of conditions affecting multiple parts of the body. By using advanced technology to gather data, studying clinical signs and lab results, and discussing symptoms with you and your veterinarian, **our internal medicine service provides expert insight and treatment for your pet's condition.**

NOTES

INFORMATION

An internist can diagnose many types of infectious diseases and immune system disorders, treating complicated diseases that affect the gastrointestinal tract, urinary system, hormone systems, blood, lungs, liver, and pancreas.

When you can tell something is wrong with your pet, but the underlying cause isn't clear, your primary veterinarian may refer you to one of our internists for further diagnostics. The internist will begin diagnosing and treating the patient, sharing test results and lab work with your primary veterinarian and any other required specialists to create an appropriate treatment plan for your pet.
